# 1969: Man on the Moon

- How can you prove that you are at a specific location?

# What will you learn from this Talk?

- Classical Cryptography
- Introduction to Quantum Mechanics
- Quantum Key Distribution
- Position-Based Cryptography

# Ancient Cryptography

Scytale

Blaise de Vigenère

Caesar Cipher (ROT4)  
(variant still [in use](#))

# Ancient Cryptography

Charles Babbage

Claude Shannon

Diffie / Hellman

“a cryptographic system should be secure even if everything but the key is known to the adversary”

 Auguste Kerckhoffs

Enigma

Alan Turing  
([The Imitation Game](#))

# Modern Cryptography

- is everywhere!
- is concerned with all settings where people do not trust each other

Edward Snowden

# Secure Encryption

$m = \text{'0d00e1ybl'}$

Alice

$k = 0101\ 1011$

Eve

Bob

$k = 0101\ 1011$

- Goal: Eve **does not learn** the message
- Setting: Alice and Bob share a secret key  $k$

# eXclusive OR (XOR) Function

8

x	y	$x \oplus y$
0	0	0
1	0	1
0	1	1
1	1	0

- Some properties:

- $\forall x : x \oplus 0 = x$
  - $\forall x : x \oplus x = 0$
- $\implies \forall x, y : x \oplus y \oplus y = x$

# One-Time Pad Encryption

- Goal: Eve **does not learn** the message
- Setting: Alice and Bob share a key  $k$
- Recipe:

$$m = 0000\ 1111$$

$$k = 0101\ 1011$$

$$c = m \oplus k = 0101\ 0100$$

$$c = 0101\ 0100$$

$$k = 0101\ 1011$$

$$c \oplus k = 0000\ 1111$$

$$c \oplus k = m \oplus k \oplus k = m \oplus 0 = m$$

x	y	$x \oplus y$
0	0	0
0	1	1
1	0	1
1	1	0

- Is it secure?

# Perfect Security

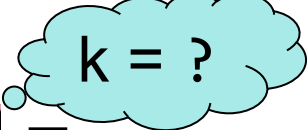

$m = ?$

Alice

$k = ?$

$c = m \oplus k = 0101\ 0100$

Eve

$m = c \oplus k = ?$

Bob

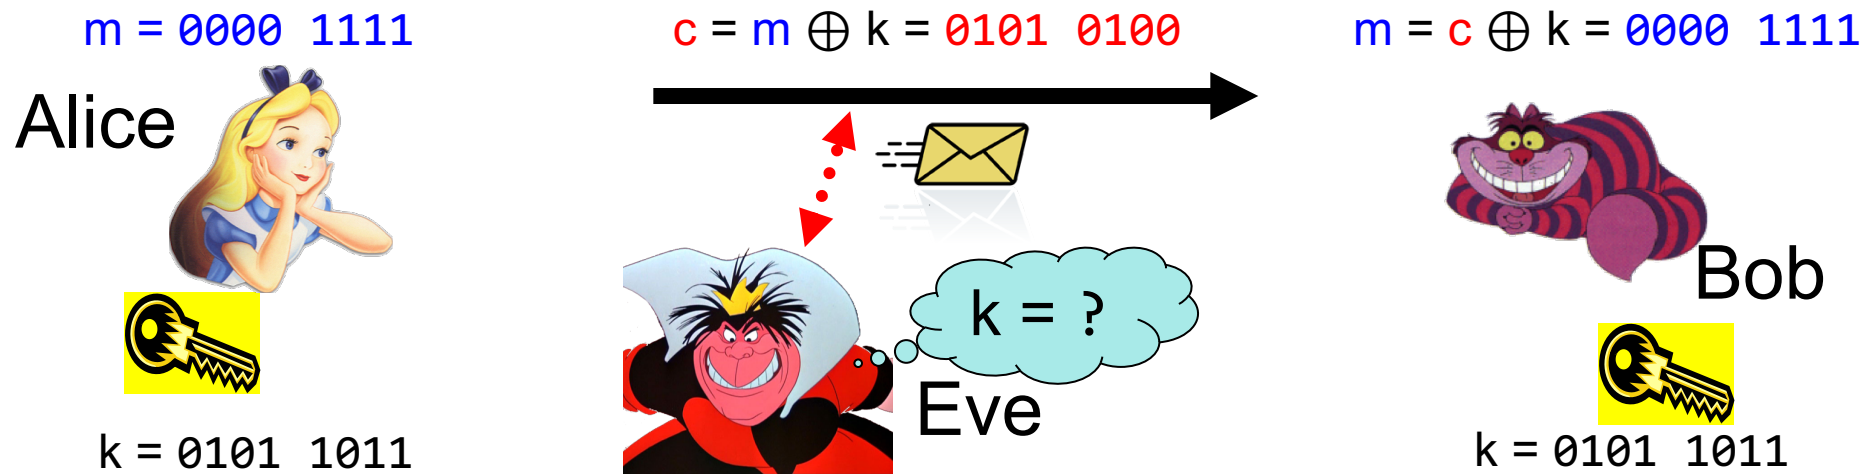

$k = ?$

- Given that
  - is it possible that
    - Yes, if
  - is it possible that
    - Yes, if
  - it is possible that
    - Yes, if
- In fact, every  $m$  is possible.
- Hence, the one-time pad is **perfectly secure!**

$c = 0101\ 0100,$   
 $m = 0000\ 0000\ ?$   
 $k = 0101\ 0100.$   
 $m = 1111\ 1111\ ?$   
 $k = 1010\ 1011.$   
 $m = 0101\ 0101\ ?$   
 $k = 0000\ 0001$

x	y	$x \oplus y$
0	0	0
0	1	1
1	0	1
1	1	0

# Problems With One-Time Pad

- The key has to be **as long as** the message.
- The key can only be **used once**, otherwise information might leak.
- In practice, other encryption schemes (such as AES) are used which allow to encrypt long messages with short keys.
- One-time pad does not provide authentication:  
Eve can easily flip bits in the message

# What will you Learn from this Talk?

✓ Classical Cryptography

- Introduction to Quantum Mechanics
- Quantum Key Distribution
- Position-Based Cryptography

# Quantum Bit: Polarization of a Photon

qubit as unit vector in  $\mathbb{C}^2$

# Qubit: Rectilinear/Computational Basis

# Detecting a Qubit

# Measuring a Qubit

# Diagonal/Hadamard Basis

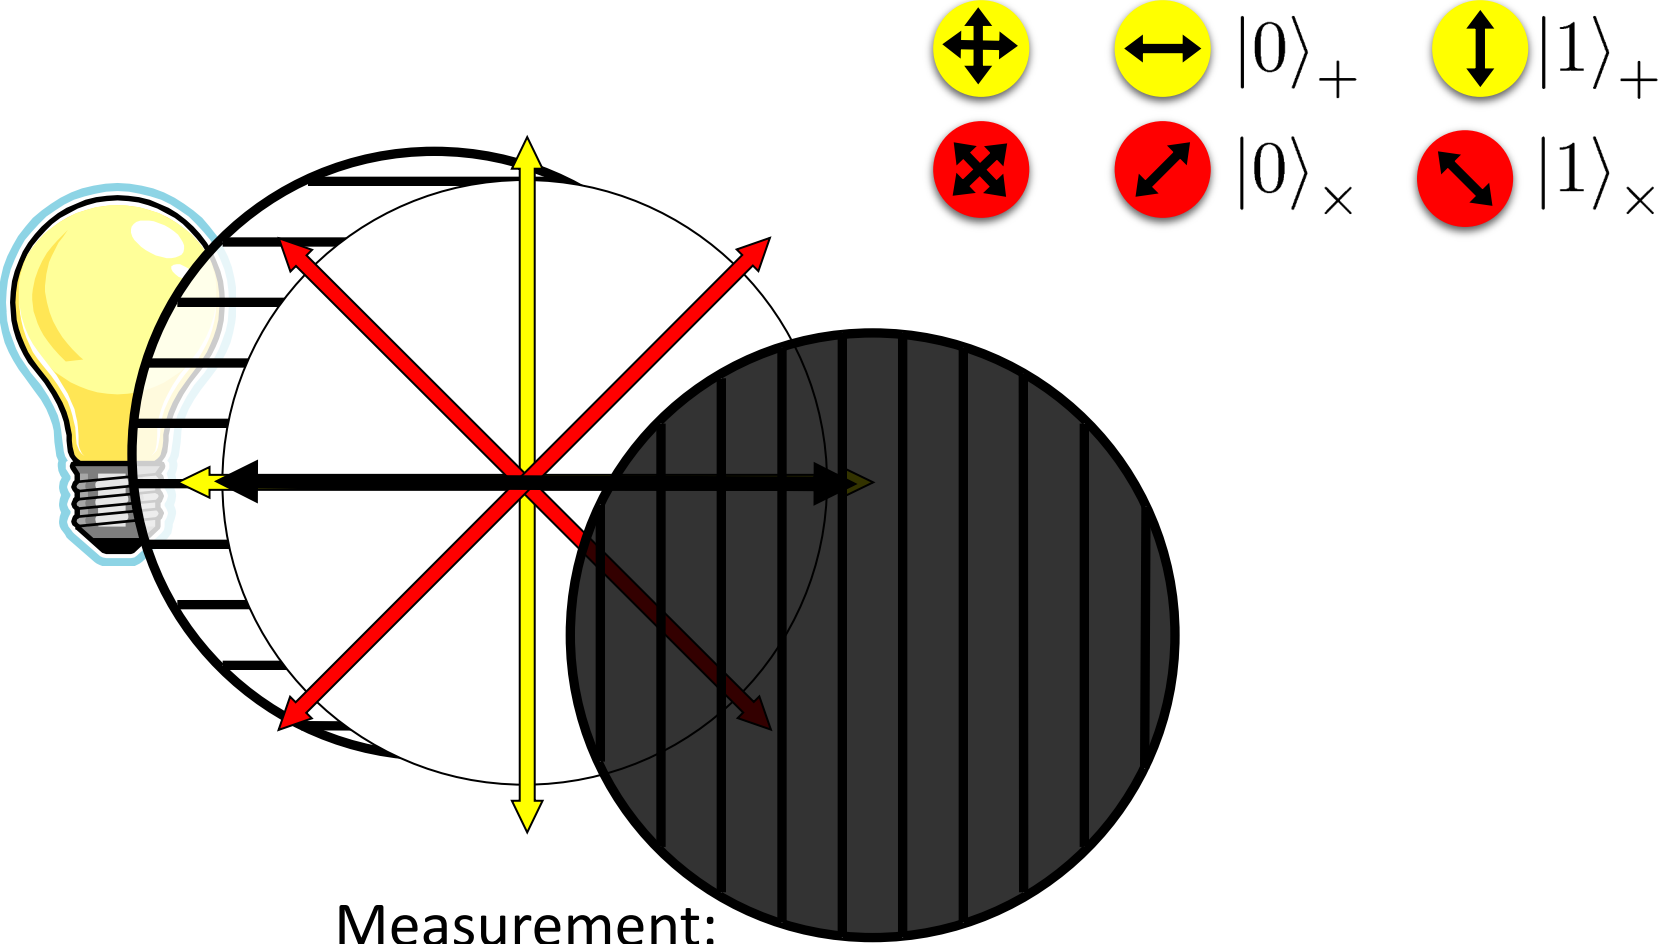

Measurement:

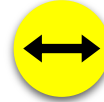

$$\frac{|0\rangle_+ + |1\rangle_+}{\sqrt{2}} = |0\rangle_x \text{ (with prob. } \frac{1}{2} \text{ yields 0)} + |1\rangle_x \text{ (with prob. } \frac{1}{2} \text{ yields 1)}$$

# Video

# Measuring Collapses the State

- 
-   $|0\rangle_+$
-   $|1\rangle_+$
- 
-   $|0\rangle_x$
-   $|1\rangle_x$

Measurement:

$$\frac{\begin{matrix} \text{yellow circle with horizontal arrow} \\ + \\ \text{yellow circle with vertical arrow} \end{matrix}}{\sqrt{2}} = \begin{matrix} \text{red circle with diagonal arrow} \\ \text{---} \\ \boxed{\begin{matrix} \text{yellow circle with crosshair} \\ \text{yellow circle with horizontal arrow} \end{matrix}} \\ \text{---} \\ \text{0/1} \end{matrix}$$

with prob. ½ yields 0 

with prob. ½ yields 1 

# Measuring Collapses the State

# Quantum Mechanics

+ basis

$|0\rangle_+$

$|1\rangle_+$

x basis

$|0\rangle_x$

$|1\rangle_x$

Measurements:

with prob. 1 yields 1

0/1

0/1

with prob.  $\frac{1}{2}$  yields 0

with prob.  $\frac{1}{2}$  yields 1

Quantum operations:

# Wonderland of Quantum Mechanics

# What will you Learn from this Talk?

✓ Classical Cryptography

✓ Introduction to Quantum Mechanics

■ Quantum Key Distribution

■ Position-Based Cryptography

# No-Cloning Theorem

Proof: copying is a **non-linear operation**

# Quantum Key Distribution (QKD)

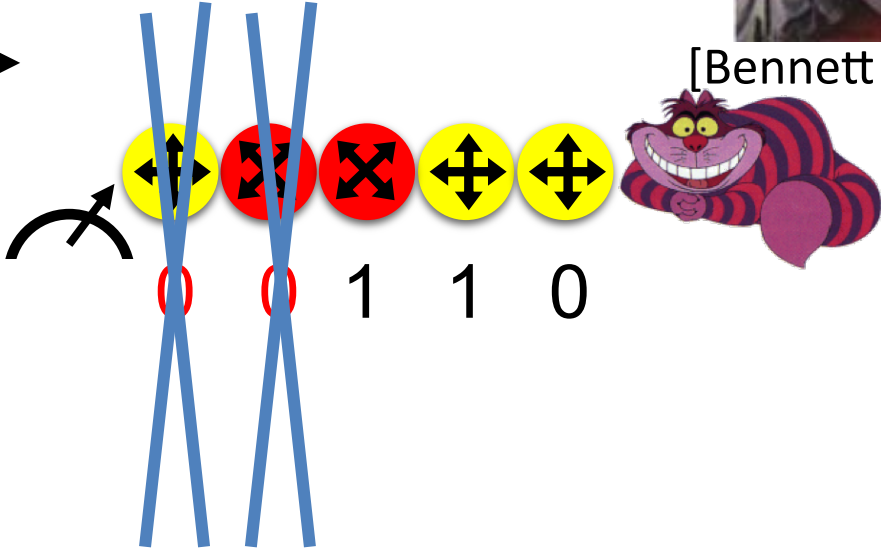

- Offers a **quantum solution** to the key-exchange problem
- Puts the players into the starting position to use symmetric-key cryptography (encryption, authentication etc.).

# Quantum Key Distribution (QKD)

[Bennett Brassard 84]

  
k = 110

  
k = 110

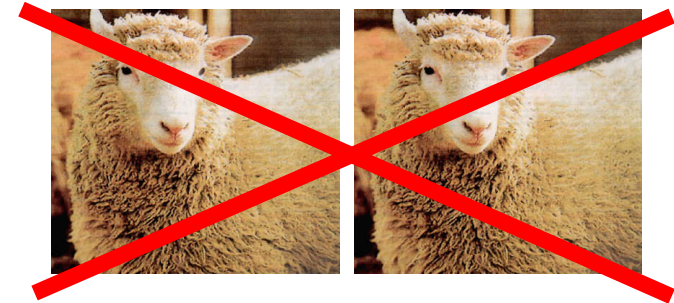

# Quantum Key Distribution (QKD)

[Bennett Brassard 84]

- Quantum states are unknown to Eve, she **cannot copy them**.
- Honest players can **test** whether Eve interfered.

# Quantum Key Distribution (QKD)

[Bennett Brassard 84]

- technical only

# Quantum Hacking

e.g. by the group of [Vadim Makarov](#) (Quantum Hacking Lab, Moscow)

# What will you Learn from this Talk?

- ✓ Classical Cryptography
- ✓ Introduction to Quantum Mechanics
- ✓ Quantum Key Distribution
- Position-Based Cryptography

# Position-Based Cryptography

- Typically, cryptographic players use **credentials** such as
  - secret information (e.g. password or secret key)
  - authenticated information 
  - biometric features

Can the geographical location of a player be used as cryptographic credential ?

# Position-Based Cryptography

Can the geographical location of a player be used as sole cryptographic credential ?

- Possible Applications:
  - Launching-missile command comes from within your military headquarters
  - Talking to your embassy
  - Pizza-delivery problem / avoid fake calls to emergency services
  - ...

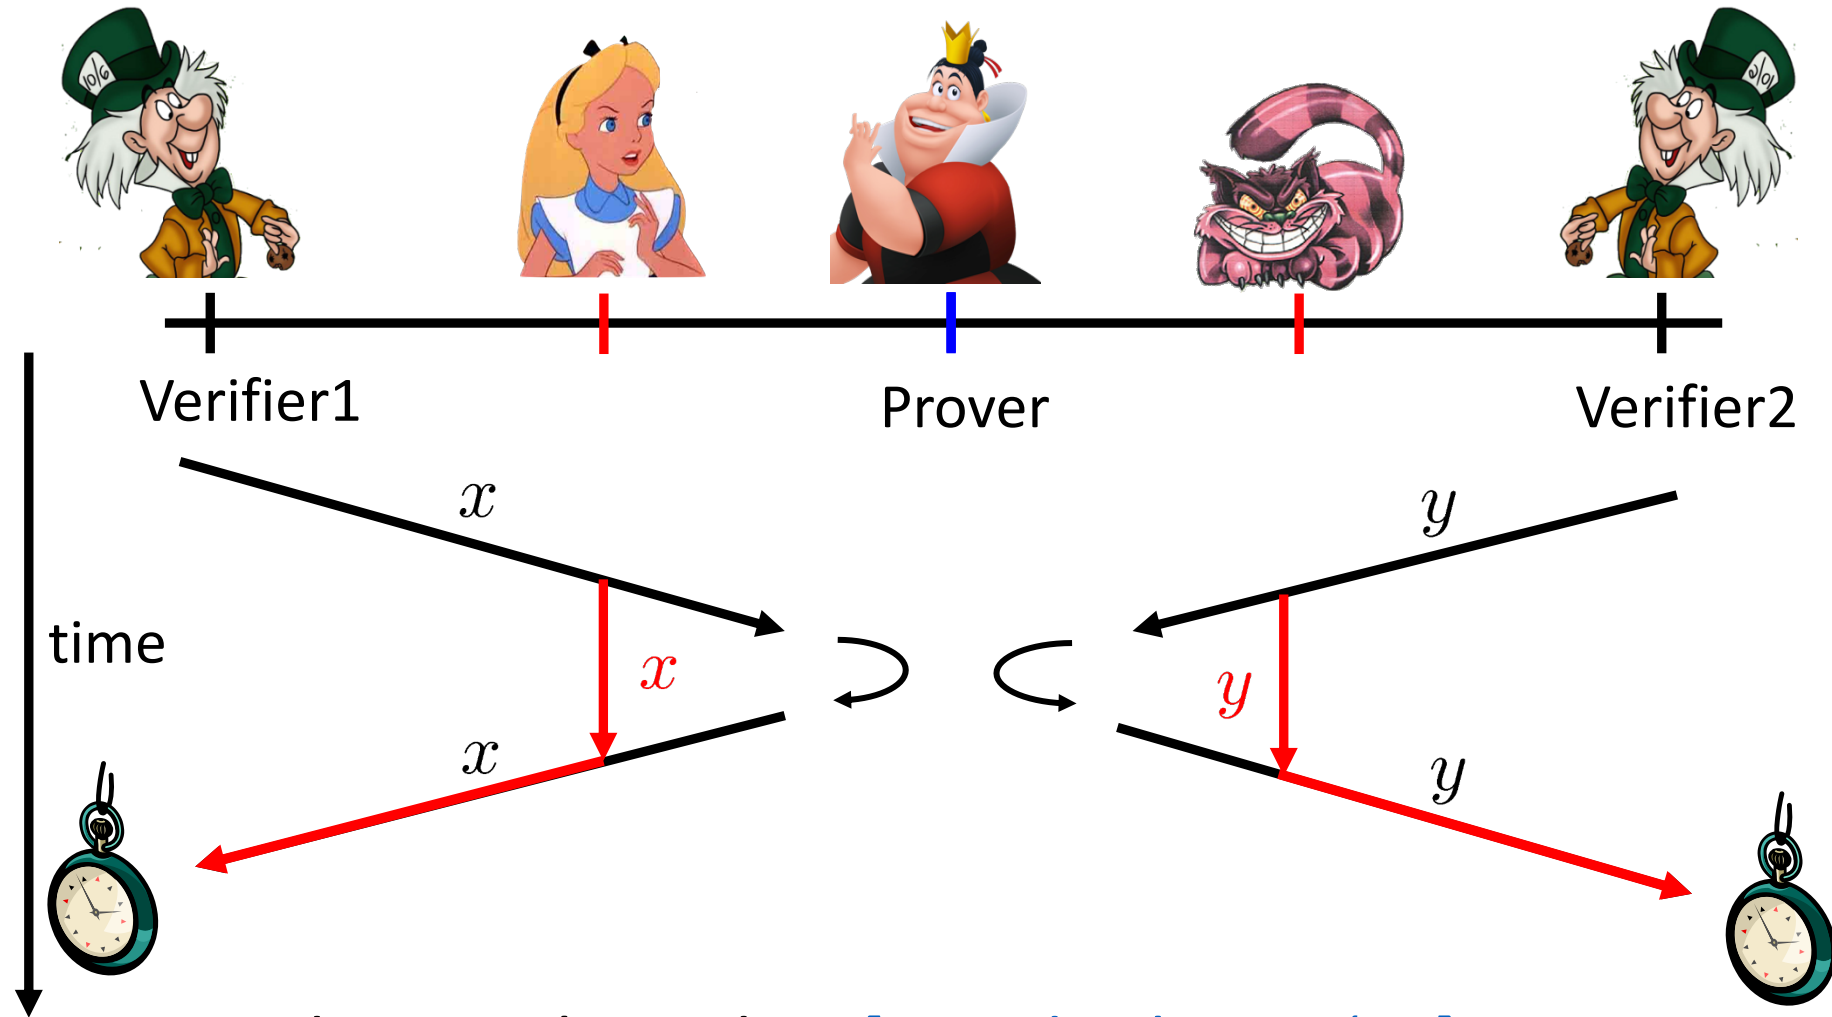

# Basic task: Position Verification

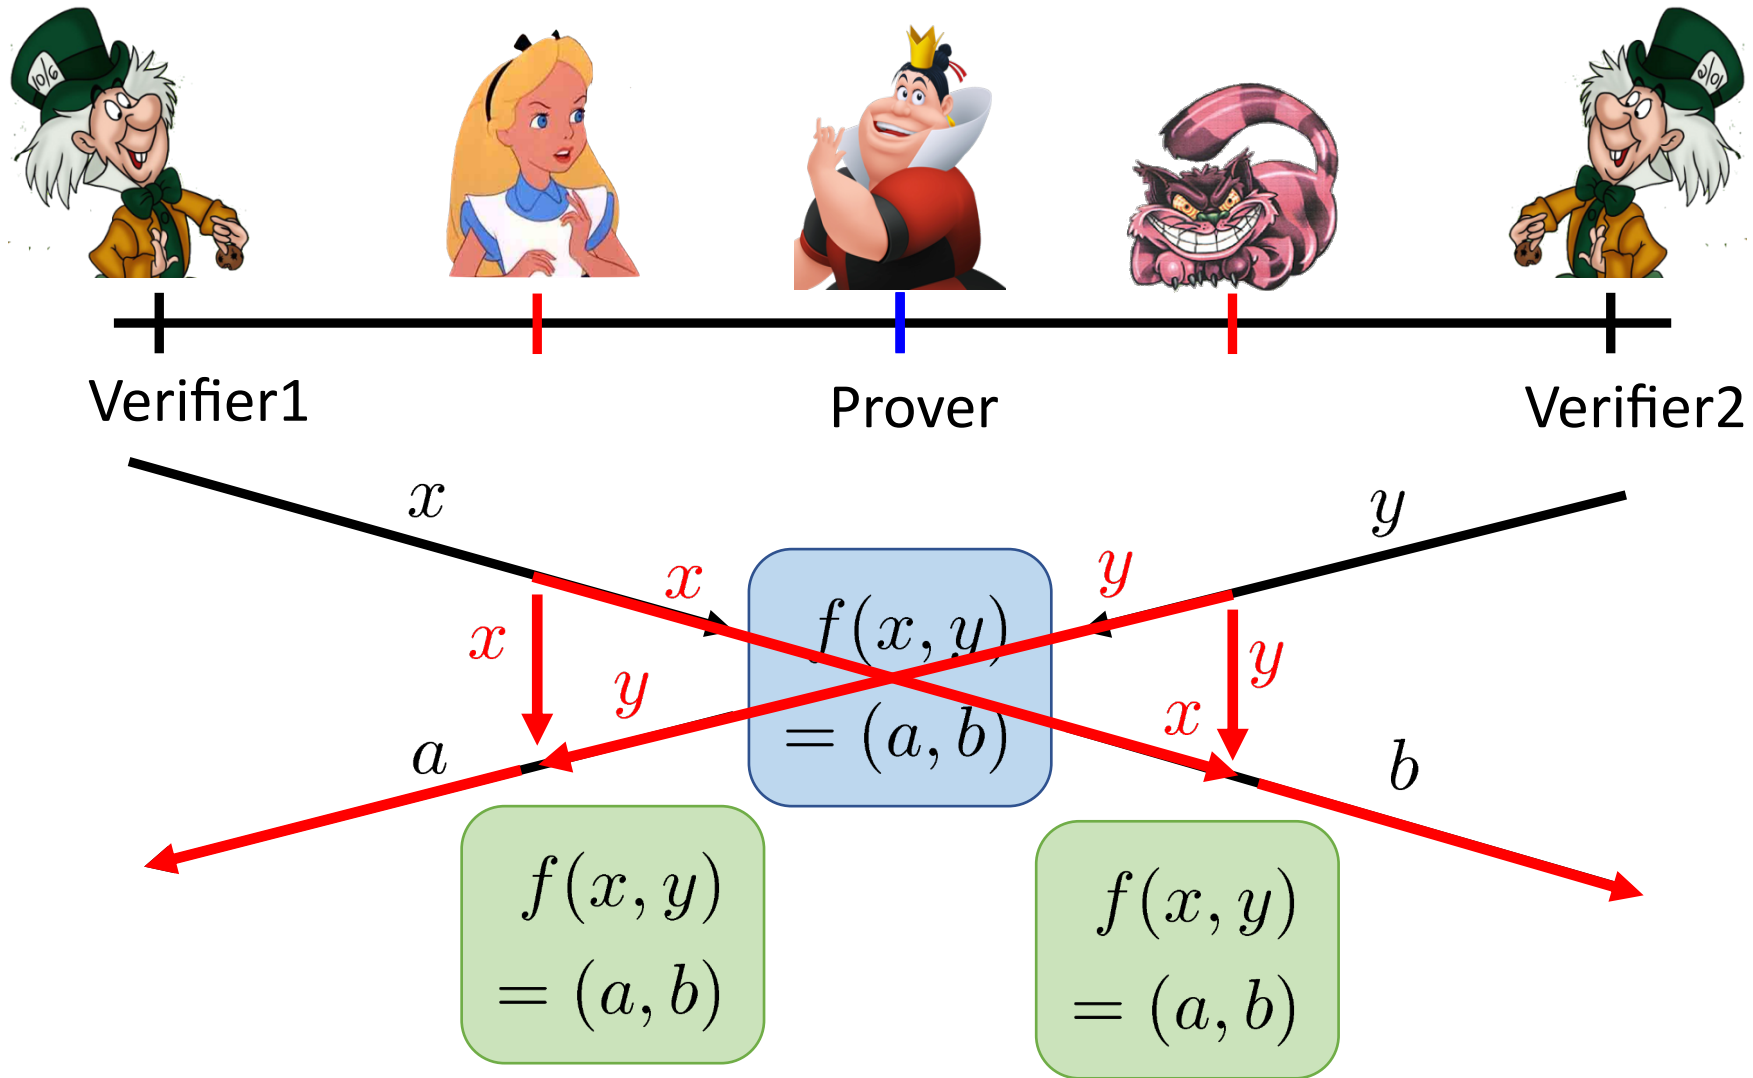

- Prover wants to convince verifiers that she is at a **particular position**
- no **coalition of (fake) provers**, i.e. not at the claimed position, can convince verifiers
- (over)simplifying assumptions:
  - communication at speed of light
  - instantaneous computation
  - verifiers can coordinate

# Position Verification: First Try

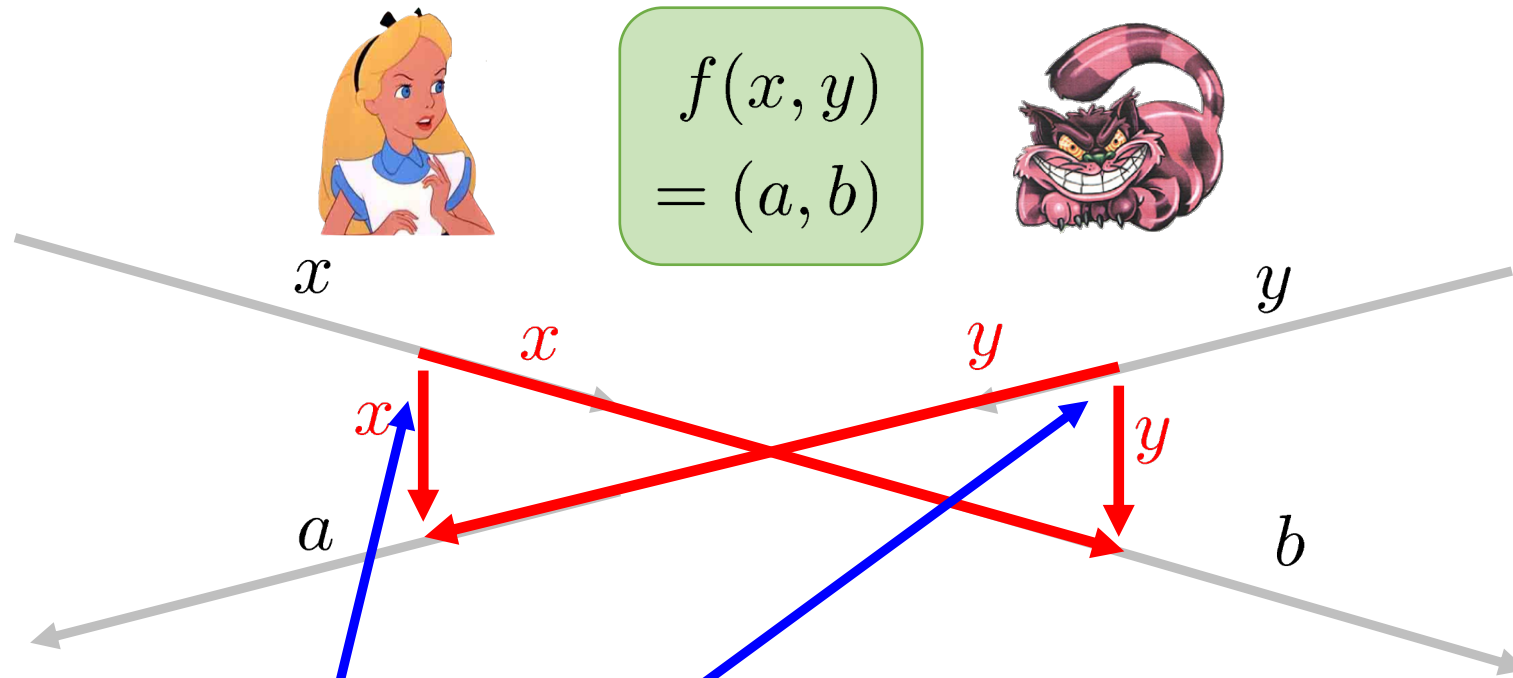

■ distance bounding [\[Brands Chaum '93\]](#)

# Position Verification: Second Try

position verification is classically impossible !

# The Attack

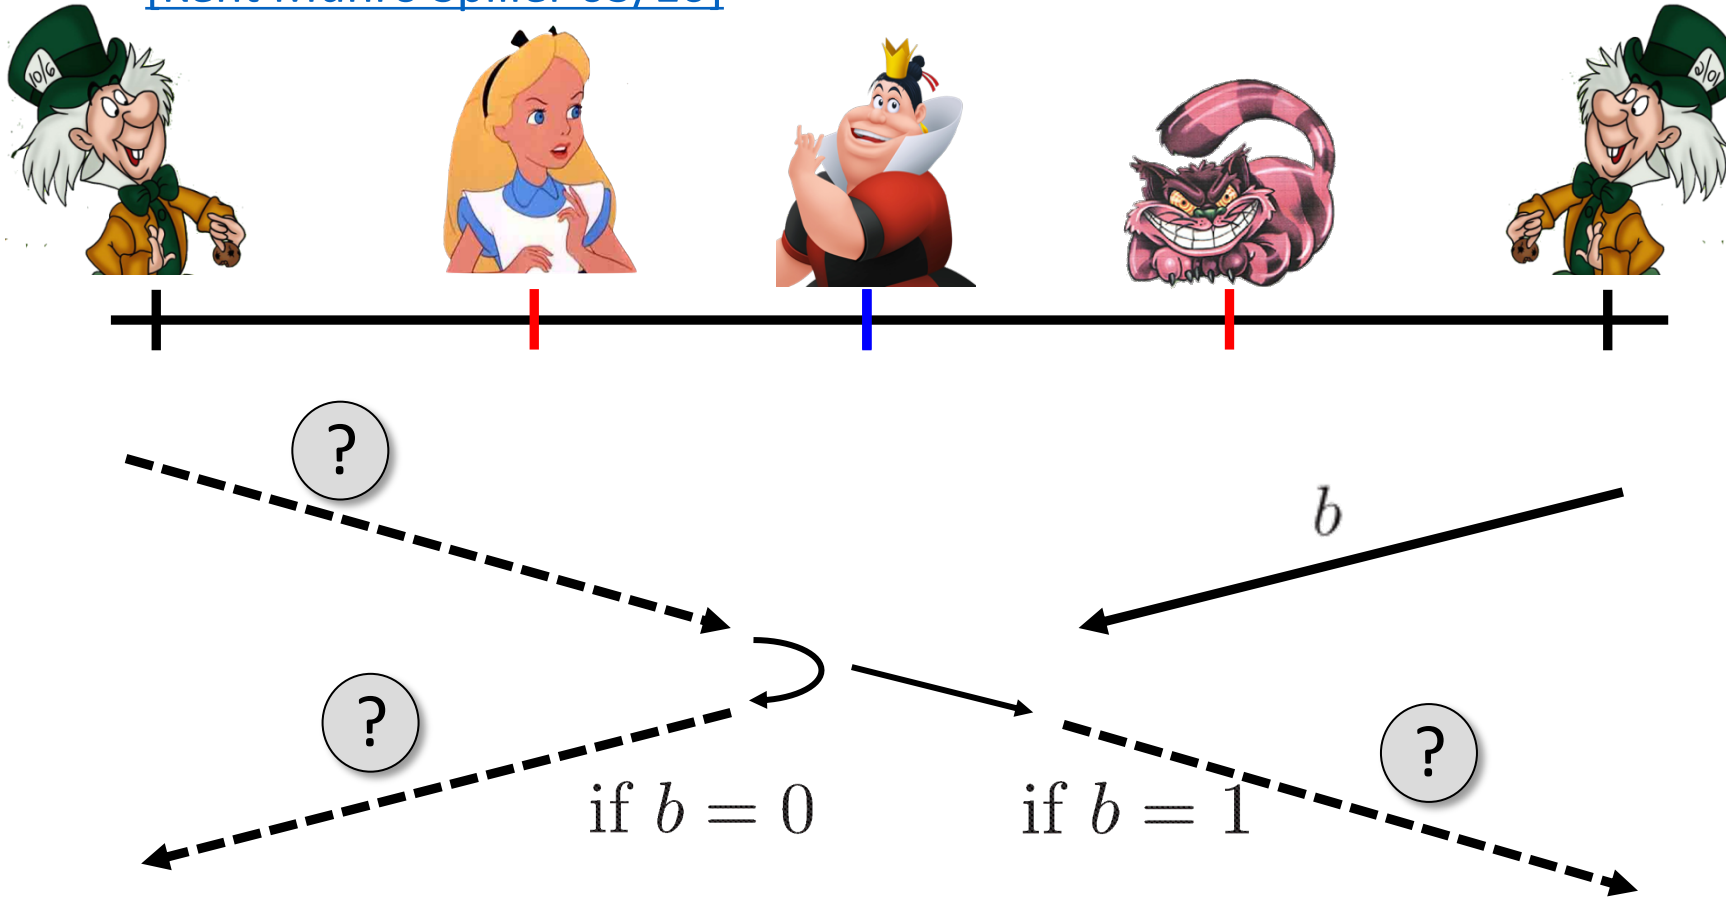

- copying classical information
- this is impossible quantumly

# Position Verification: Quantum Try

[Kent Munro Spiller 03/10]

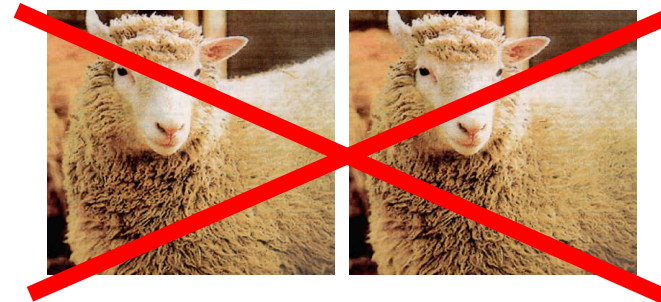

- Can we brake the scheme now?

# Attacking Game

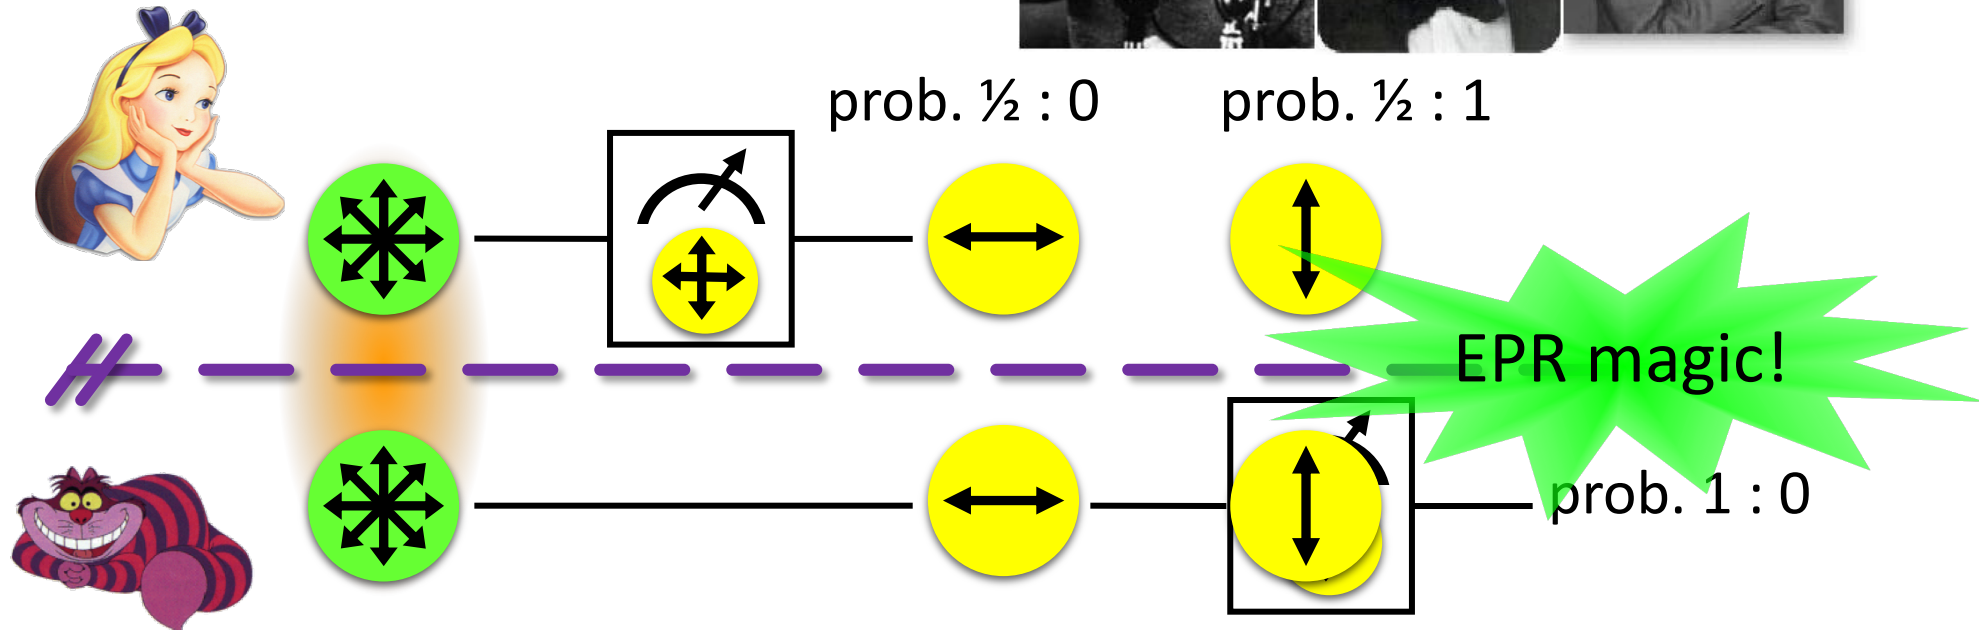

- Impossible to cheat due to no-cloning theorem
- Or not?

# EPR Pairs

[Einstein Podolsky Rosen 1935]

- “spukhafte Fernwirkung” (spooky action at a distance)
- EPR pairs **do not allow to communicate** (no contradiction to relativity theory)
- can provide a shared random bit

# Quantum Teleportation

[Bennett Brassard Crépeau Jozsa Peres Wootters 1997]

- does **not contradict relativity theory**
- teleported state can only be recovered once the classical information  $\sigma$  arrives

# Teleportation Attack

- It is **possible to cheat** with entanglement !!
- Quantum teleportation allows to **break the protocol perfectly**.

# No-Go Theorem

[[Buhrman, Chandran, Fehr, Gelles, Goyal, Ostrovsky, Schaffner 2010](#)] [[Beigi Koenig 2011](#)]

- Any position-verification protocol **can be broken** using an exponential number of entangled qubits.

- **Question:** Are so many quantum resources really necessary?

- Does there exist a protocol such that:
  - **honest** prover and verifiers are efficient, but
  - any **attack** requires lots of entanglement

see <https://staff.science.uva.nl/c.schaffner/positionbasedqcrypto.php> for an overview

# Relations to Different Research Areas

- Garden-hose model connects position-based crypto with **complexity theory** [Buhrman Fehr Schaffner Speelman 11]
- various **follow-up research**: IBM ponder-this puzzle, SAT solvers, symmetry [Chiu Szegedy Wang Xu 13]
- **Experimental problems**: handle **losses** and **measurement errors**
- Garden-hose techniques allowed us to build **fully homomorphic quantum encryption** [Dulek Schaffner Speelman 16]
- Attacks on position-based crypto protocols relate to the holographic principle in **quantum gravity** [May Pennington Pérez-García Sorce 19]
- Relation to **mathematics**, operator-space theory [Junge Kubicki Palazuelos Pérez-García 21]
- Relation to programmable **quantum processors** [Kubicki Palazuelos Pérez-García 19]

# Thank you for your attention!

## Questions

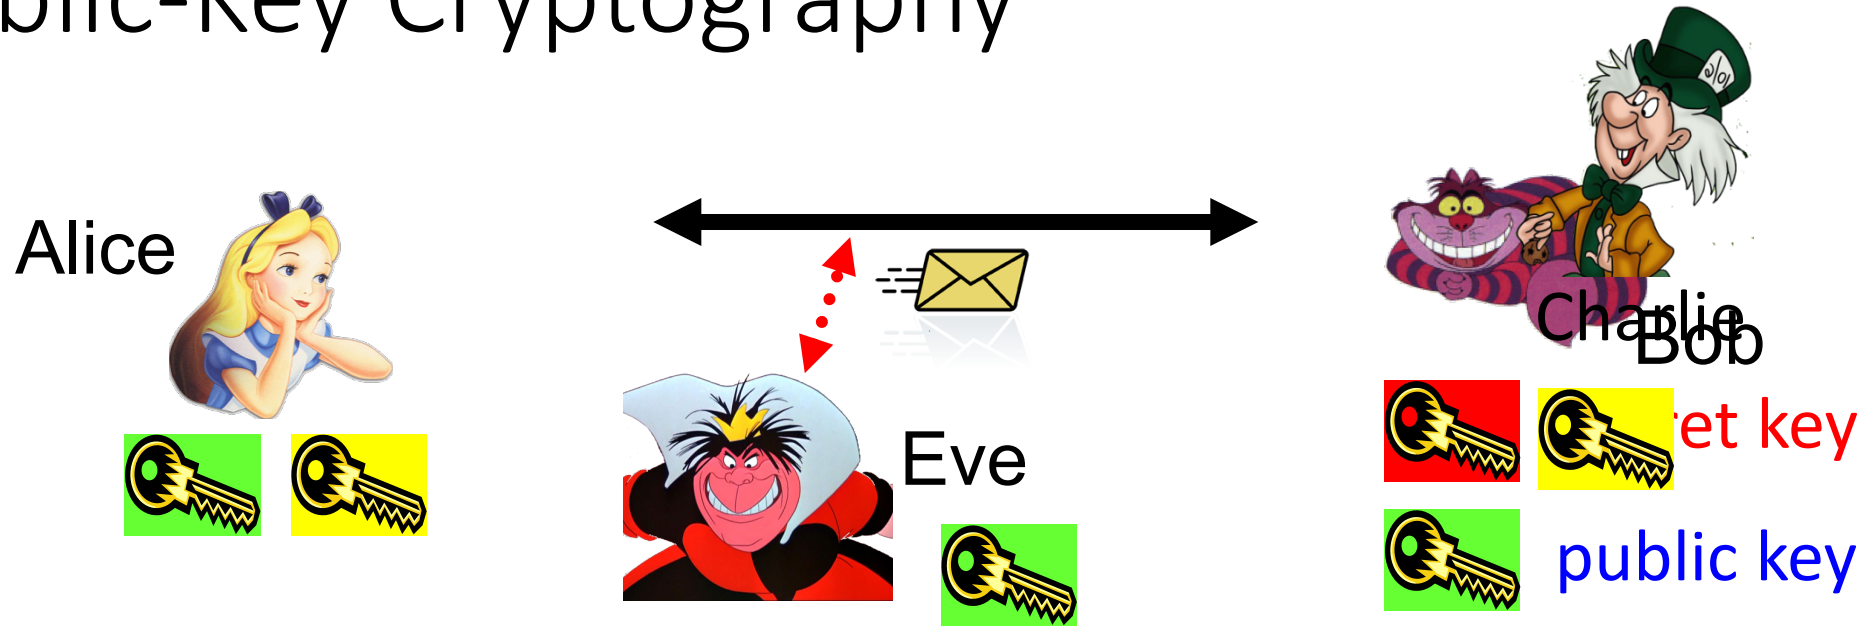

check <http://arxiv.org/abs/1510.06120> for a survey about quantum cryptography beyond key distribution

QuSoft

# Public-Key Cryptography

- Solves the key-exchange problem.
- Everyone can encrypt using the [public key](#).
- Only the holder of the **secret key** can decrypt.
- [Digital signatures](#): Only **secret-key** holder can sign, but everyone can verify signatures using the [public-key](#).

# History of Public-Key Crypto

- Early 1970s: invented in the „classified world“ at the British Government Communications Head Quarters (GCHQ) by Ellis, Cocks, Williamson

- Mid/late 1970s: invented in the „academic world“ by Merkle, Hellman, Diffie, and Rivest, Shamir, Adleman (RSA)

# Most General Single-Round Scheme

- Let us study the attacking game

# Impossibility Result by Distributed Q Computation

- Any position-verification protocol **can be broken**
  - using a double-exponential number of EPR-pairs [Buhrman Chandran Fehr Gelles Goyal Ostrovsky Schaffner 10]
  - reduced to single-exponential [Beigi König 11]
- Does there exist a protocol such that:
  - **honest** prover and verifiers efficient
  - any **attack** requires many EPR-pairs

# Can We Build Quantum Computers?

- Possible to build in theory, no fundamental theoretical obstacles have been found yet.
- Enormous technical challenge (control vs decoherence)

Company	Pref. Language	#Qubits	
IBM	QISKIT	20-65	Superconducting
<u>Rigetti</u>	Forest	31	
Google	<u>Cirq</u>	53	
Alibaba		11	
Xanadu	<u>Pennylane</u>		Photonic
<u>PsiQuantum</u>		0	
<u>IonQ</u>		32	Trapped ions
Honeywell		10	
Quantum Inspire		2 or 5	
D-Wave		5000	
Microsoft	Q# / Azure	0	
<u>UvA-Eindhoven labs</u>		0	

# Example: Lattice-Based Cryptography

- For any vectors  $v_1, \dots, v_n$  in  $\mathbb{R}^n$ , the **lattice** spanned by  $v_1, \dots, v_n$  is the set of points  $L = \{a_1v_1 + \dots + a_nv_n \mid a_i \text{ integers}\}$
- **Shortest Vector Problem (SVP)**: given a lattice  $L$ , find a shortest (nonzero) vector

# Example: Lattice-Based Cryptography

- **Shortest Vector Problem (SVP):** given a lattice, find a shortest (nonzero) vector
- **no efficient (classical or quantum) algorithms known**
- public-key encryption schemes can be built on the computational hardness of SVP
