## Where are we? I

#### Hard Homogeneous Spaces (Couveignes [Could

A hard homogeneous space  $(\mathcal{E}, \mathcal{G})$  is

- a set *E*,
- a group  $(\mathcal{G},\odot)$  and
- an action  $*: \mathcal{G} \times \mathcal{E} \to \mathcal{E}$

#### Properties of \*

- Compatibility:  $\forall g, g' \in \mathcal{G} \ \forall E \in \mathcal{E} \colon g * (g' * E) = (g \odot g') E$
- Identity:  $\forall E \in \mathcal{E} : i * E = E \Leftrightarrow i$  is the neutral element in  $\mathcal{G}$
- Transitivity:  $\forall E, E' \in \mathcal{E} \exists ! g \in \mathcal{G} \colon g * E = E'$

## Where are we? II

#### Notation

For arbitrary  $E \in \mathcal{E}$ ,  $g \in \mathcal{G}$  with prime order  $p | \# \mathcal{G}$  and  $s \in \mathbb{Z}_p$ , we denote

$$[s] E := g^s * E.$$

#### Remark

For  $s, s' \in \mathbb{Z}_p$  and  $E \in \mathcal{E}$ , we have

$$[s]\left(\left[s'\right]E\right) = \left[s+s'\right]E.$$

#### The Group Action Inverse Problem (GAIP)

Given two elements  $E, E' \in \mathcal{E}$ , find  $g \in \mathcal{G}$  with

$$g * E = E'.$$

Secret Sharing Schemes

• Distribute a secret s among shareholders  $P_1, \ldots, P_n$  via

S.Share(s)

• Reconstruct a shared secret via

$$\mathcal{S}.\mathsf{Rec}\Big(\{s_i\}_{P_i\in S'}\Big)$$

for an authorised set  $S' \in \Gamma$ .

Definition (Superauthorised Sets)

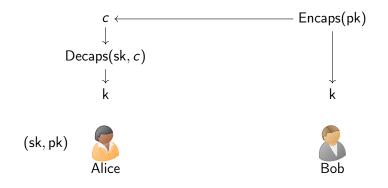

A superauthorised set of shareholders is a set  $S^*$ , so that

 $\forall P \in S^* \colon S^* \setminus \{P\} \in \Gamma.$

Decapsulation w/ Shared Secret [FM20]

- \* ロ \* \* 個 \* \* ヨ \* \* ヨ \* - ヨ - のへで

### Features of the Protocol

#### Threshold Group Action

$$E^{\#S'} = \left[L_{j,S'}s_j\right]\left([\ldots]E^0\right) = \left[\sum_{P_i \in S'}L_{i,S'}s_i\right]E^0 = [s]c.$$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

#### Advantages

- Simulatable
- Authorised set of shareholders suffices
- Turn order is variable

### Features of the Protocol

#### Threshold Group Action

$$E^{\#S'} = \left[L_{j,S'}s_j\right]\left([\ldots]E^0\right) = \left[\sum_{P_i\in S'}L_{i,S'}s_i\right]E^0 = [s]c.$$

#### Advantages

- Simulatable
- Authorised set of shareholders suffices
- Turn order is variable

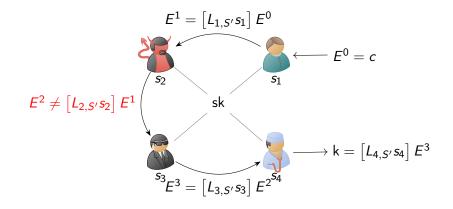

#### Problem

Passive security: misbehaving shareholders cannot be detected.

### Measures for Active Security

Definition (Zero-knowledge Proof of Knowledge in  $(\mathcal{E}, \mathcal{G})$ [3DPV2.])

A party proves knowledge of s with

$$[s] E_i = E'_i$$

for pairs  $(E_i, E'_i) \in \mathcal{E}^2$ ,  $i = 1, \ldots, m$ .

#### Definition (Piecewise Verifiable Proof

A party proves knowledge of a polynomial f for a statement

$$x=\left(\left(E_0,E_1\right),s_1,\ldots,s_n\right),$$

where  $E_1 = [f(0)] E_0$  and  $s_i = f(i) \in \mathbb{Z}_p$  for  $i = 1, \ldots, n$ .

Motivation Actively Secure Key Exchange	Deriving a Signature Scheme	General Secret Sharing Schemes	References
0000000 000000	0	000	000

What to do?

- Transfer PVP proof to threshold setting
- Integrate both to decapsulation protocol to achieve active security
- Prove, that resulting protocol is at least as secure as original decapsulation

MotivationActively Secure Key Exchange<br/>00000000Deriving a Signature Scheme<br/>00000000General Secret Sharing Schemes<br/>000References<br/>0000

### Key Generation

KeyGen(S)  $\mathsf{sk} \leftarrow \mathbb{Z}_p$  $pk \leftarrow [sk] E_0$  $\{s_1,\ldots,s_n\} \leftarrow S$ .Share(s) for i = 1, ..., n $f_i \leftarrow \mathbb{Z}_p[X]_{\leq k-1} : f_i(0) = s_i$ endfor publish pk for i = 1, ..., nsend  $\left\{ s_i, f_i, \left\{ f_j(i) \right\}_{j=1,...,n} \right\}$  to  $P_i$ endfor

## Shareholder $P_i$ 's Turn in the Decapsulation I

Let  $S^*$  be a superauthorised set of shareholders executing the decapsulation protocol.

- Ascertain  $E^{k-1} \in \mathcal{E}$ , where  $E^{k-1}$  is previous shareholder's output or  $E^0 = c$
- Sample  $R_k \leftarrow \mathcal{E}$ , compute  $R'_k \leftarrow [L_{i,S^*}s_i] R_k$ .
- Ompute and publish

$$\begin{pmatrix} \pi^{k}, \left\{\pi_{j}^{k}\right\}_{P_{j}\in S^{*}} \end{pmatrix} \leftarrow \mathsf{PVP}.P(i, f_{i}, S^{*}, \left(\left(R_{k}, R_{k}^{\prime}\right), (f_{i}(j))_{P_{j}\in S^{*}}\right)), \\ E^{k} \leftarrow [L_{i,S^{*}}s_{i}] E^{k-1}, \\ zk \leftarrow \mathsf{ZK}.P(\left(R_{k}, R_{k}^{\prime}\right), \left(E^{k-1}, E^{k}\right), L_{i,S^{*}}s_{i}).$$

### Shareholder $P_i$ 's Turn in the Decapsulation II

• All other participants  $P_j \in S^*$  verify

$$PVP.V(i, j, S^*, f_i(j), (\pi^k, \pi_j^k)),$$
  

$$PVP.V(i, 0, S^*, (R_k, R'_k), (\pi^k, \pi_0^k)),$$
  

$$ZK.V((R_k, R'_k), (E^{k-1}, E^k), zk).$$

- If irregularities occur and more than half the participants convict P<sub>i</sub>, the protocol is started over without P<sub>i</sub>.
- Decapsulation terminates with the last shareholder's output  $E^{\#S^*}$  as result.

### Features of our Protocol

• IND-CPA, i.e., the encapsulated key cannot be distinguished from the ciphertext, assuming the hardness of the GAIP

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

- Simulatable (as was [FM20])
- Actively secure, i.e., a misbehaving shareholder can be detected, if the PVP and ZK proof are sound

Motivation	Actively Secure Key Exchange	Deriving a Signature Scheme	General Secret Sharing Schemes	References
00000000	000000	•	000	000

#### Why actively secure signature schemes?

Correctness of a signature is easily verified with the public key and the signed message.

BUT: An incorrect signature does not identify the misbehaving shareholder.

#### Signature Scheme

- KeyGen: Keep KeyGen of the key exchange mechanism, i.e., the secret key is two-level shared among parties  $P_1, \ldots, P_n$
- Sign: Apply Fiat-Shamir-transform [FS87] to the decapsulation protocol, resulting in a signing protocol with secret shared secret key
- Vf: Arises naturally from the Fiat-Shamir-transformation

 Motivation
 Actively Secure Key Exchange
 Deriving a Signature Scheme
 General Secret Sharing Schemes
 References

 00000000
 0000000
 0000000
 0000000
 00000000

## Necessary Characteristics for Compatibility

- Independent reconstruction: a shareholder's input in reconstructing a secret is independent of other shares
- Self-contained reconstruction: the shares of a secret live in the same space as the secret to enable two-level sharing

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

• Compatibility with zero-knowledge proof and the piecewise verifiable proof in the HHS

Motivation	Actively Secure Key Exchange	Deriving a Signature Scheme	General Secret Sharing Schemes	References
00000000	000000	0	000	000

## Examples

- Shamir's polynomial secret sharing: compatible (our protocol was initially based on it)
- Tassa's hierarchical threshold secret sharing [Tas04]: compatible (extension of Shamir's approach)
- Damgard and Thorbek's linear integer secret sharing [DT06]: incompatible, since it is only computationally hiding
- Additive secret sharing: incompatible, because superauthorised sets of shareholders do not exist

Motivation	Actively Secure Key Exchange	Deriving a Signature Scheme	General Secret Sharing Schemes	References
00000000	000000	0	000	000

## Conclusion

- Transfer PVP to threshold setting
- Actively secure key exchange mechanism
- Transformed into signature scheme
- Define, which field of secret sharing schemes is compatible
