19/06/2019

SURF SARA

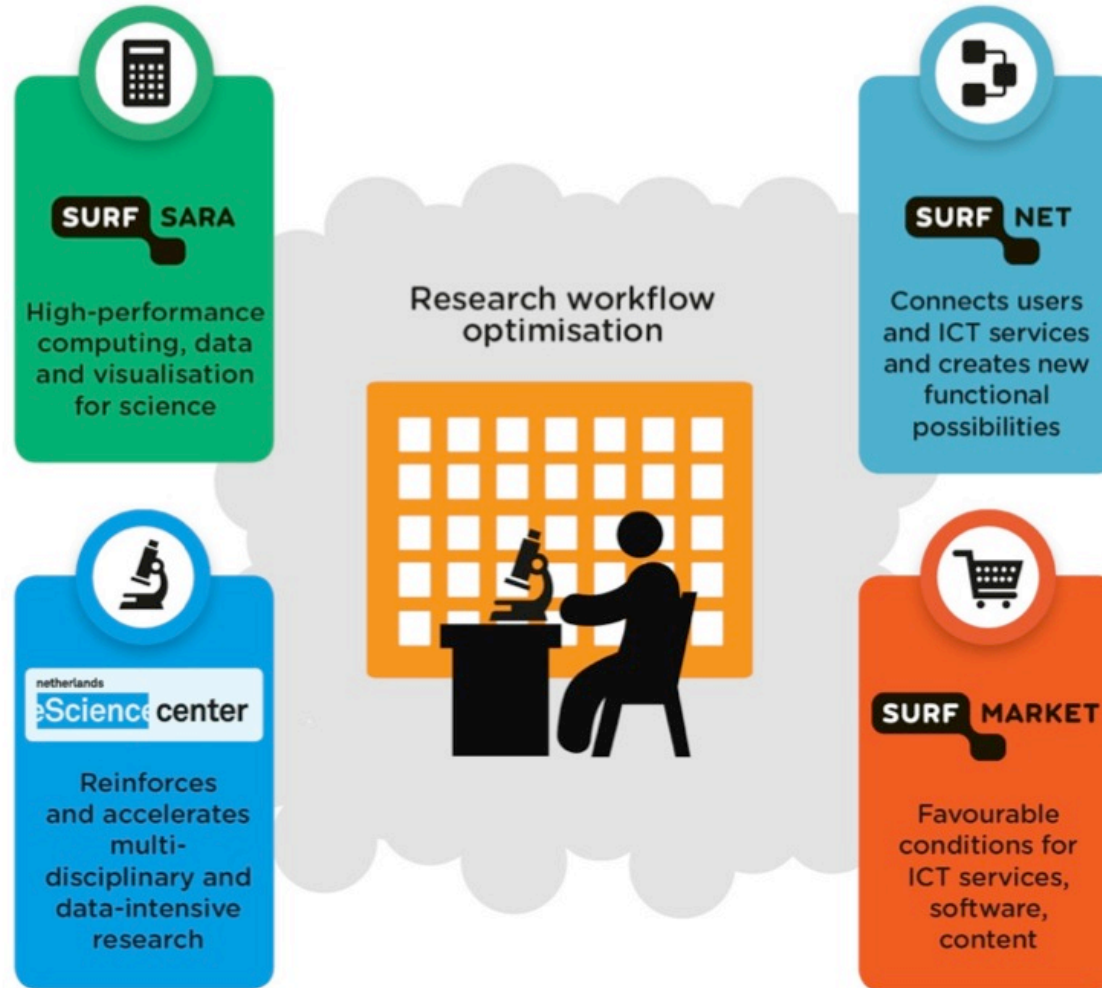

# About SURF

WO: Research-oriented higher education  
HBO: Higher professional education  
MBO: Vocational education and training  
UMC: University teaching hospital

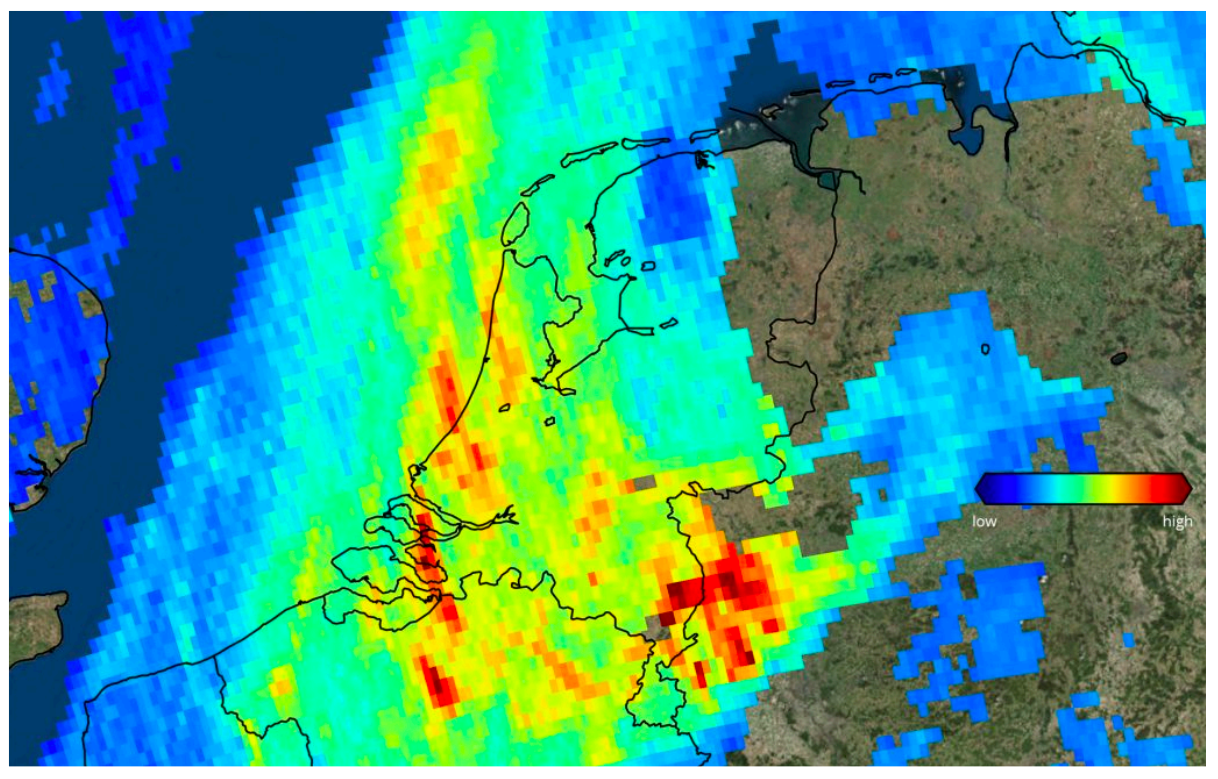

# About SURF

THE THINGS  
NETWORK

# The Green Village

# The Green Village

- <https://www.thegreenvillage.org/>
- The Green Village's site takes a unique position in the chain from fundamental research and development to large-scale application of innovations in society.

- Solving the world's largest challenges requires radically new connections. Combinations of technologies that were never linked before, or innovation partnerships between unlikely partners → **data sharing platform**
- <https://www.thegreenvillage.org/projects>

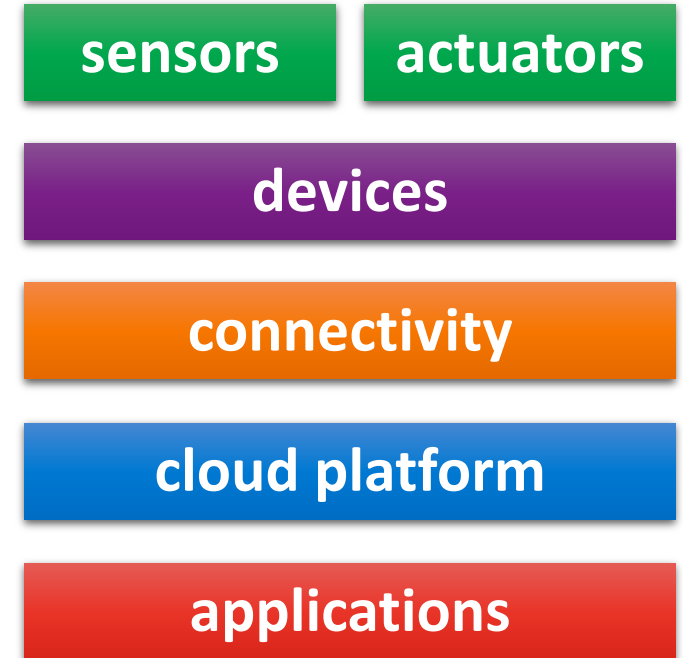

# Internet of Things

- Low cost devices
- Affordable and high speed connectivity
- Standardized communication protocols
- Affordable and available cloud computing
- Open source software and hardware
- Advances in data science and data processing

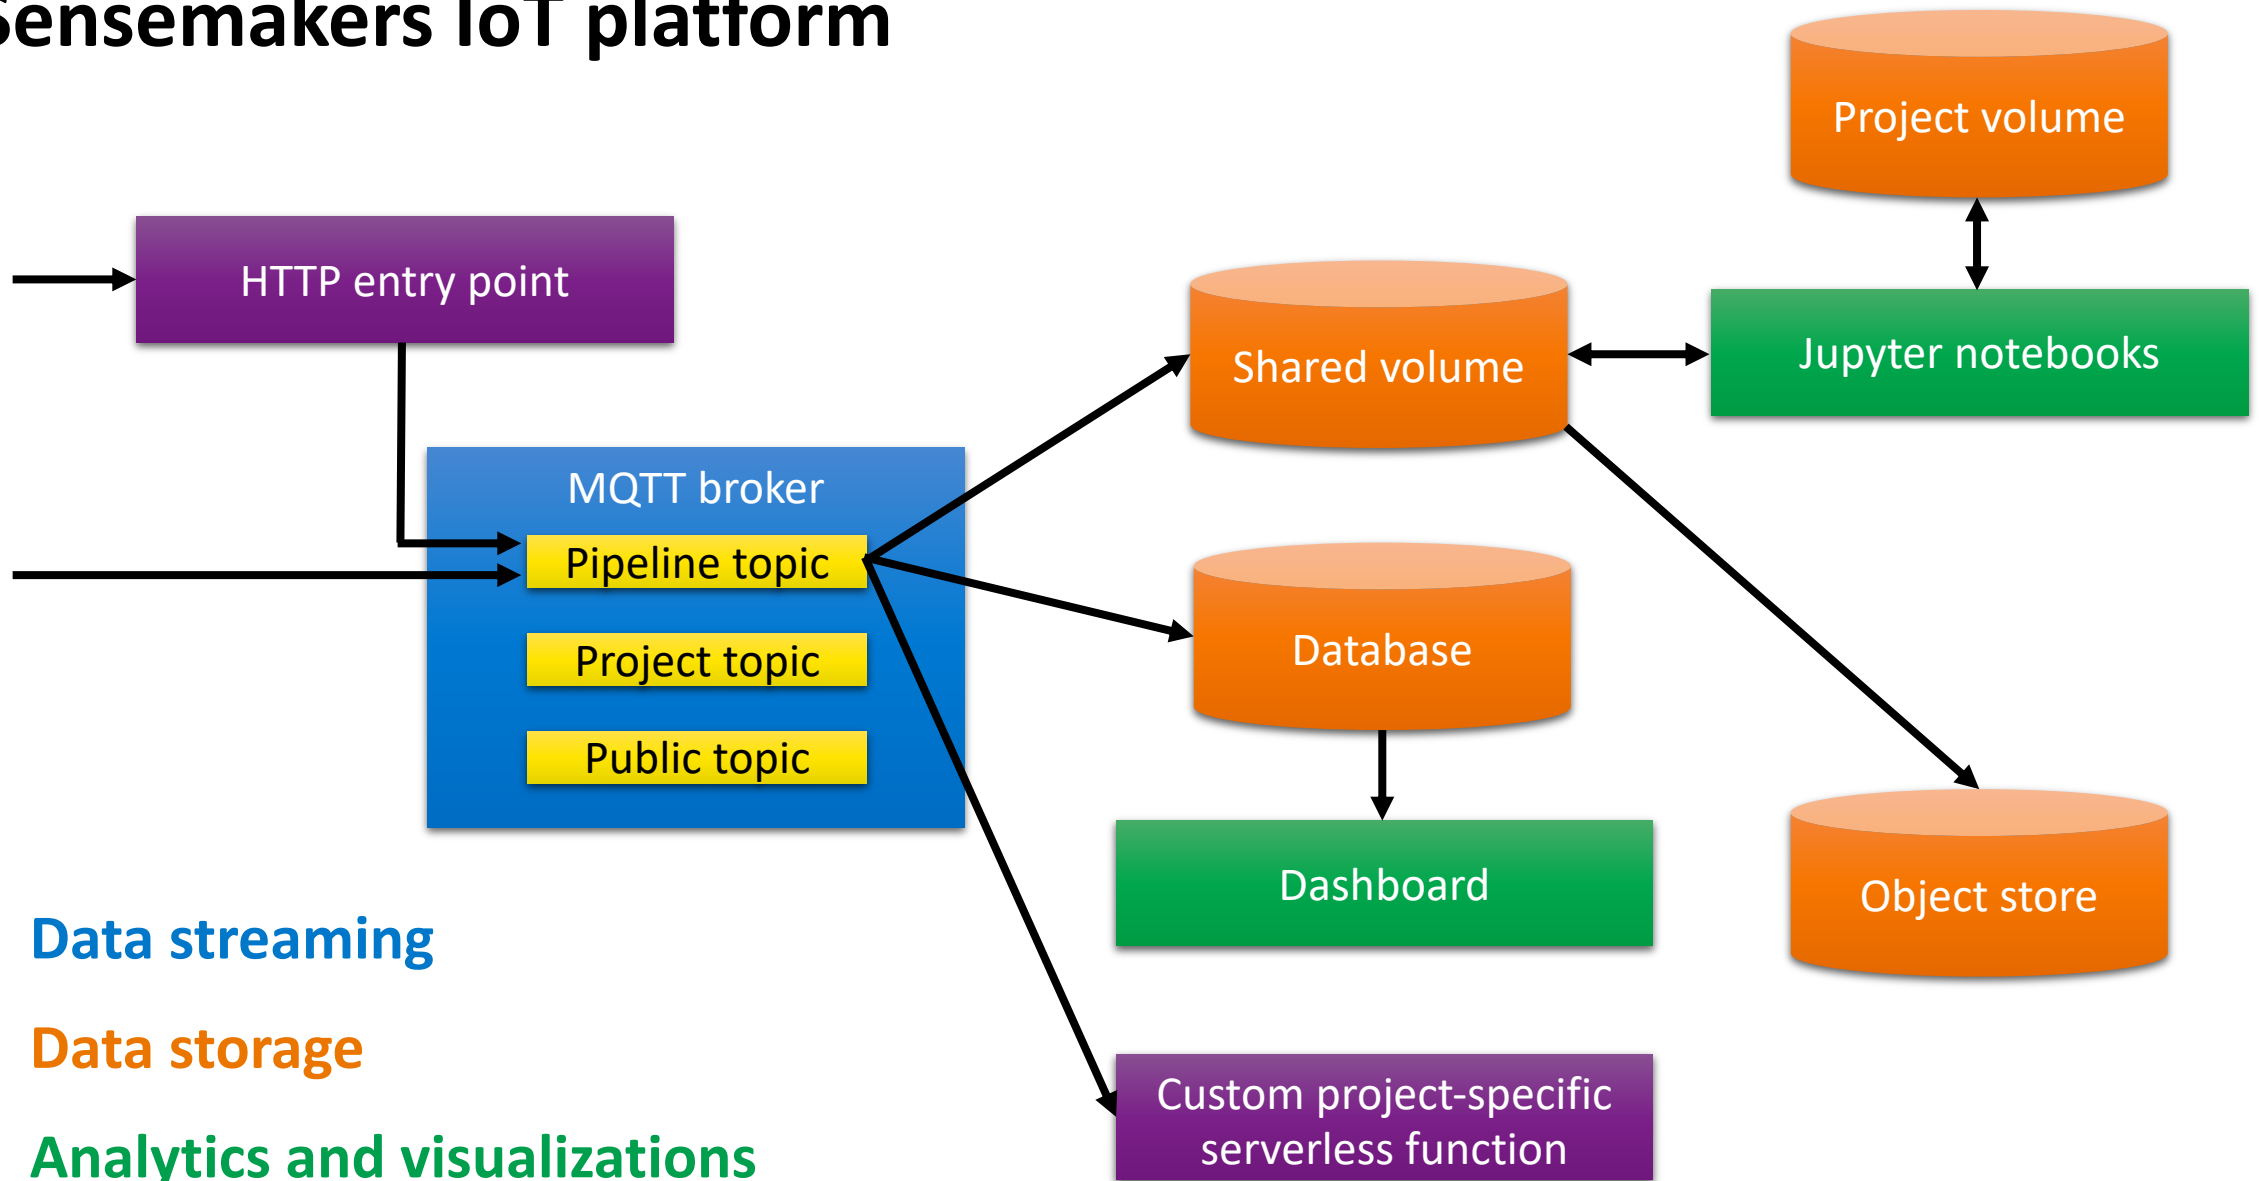

# Internet of Things

- Low cost devices
- Affordable and high speed connectivity
- **Standardized communication protocols**
- **Affordable and available cloud computing**
- **Open source software** and hardware
- Advances in data science and data processing

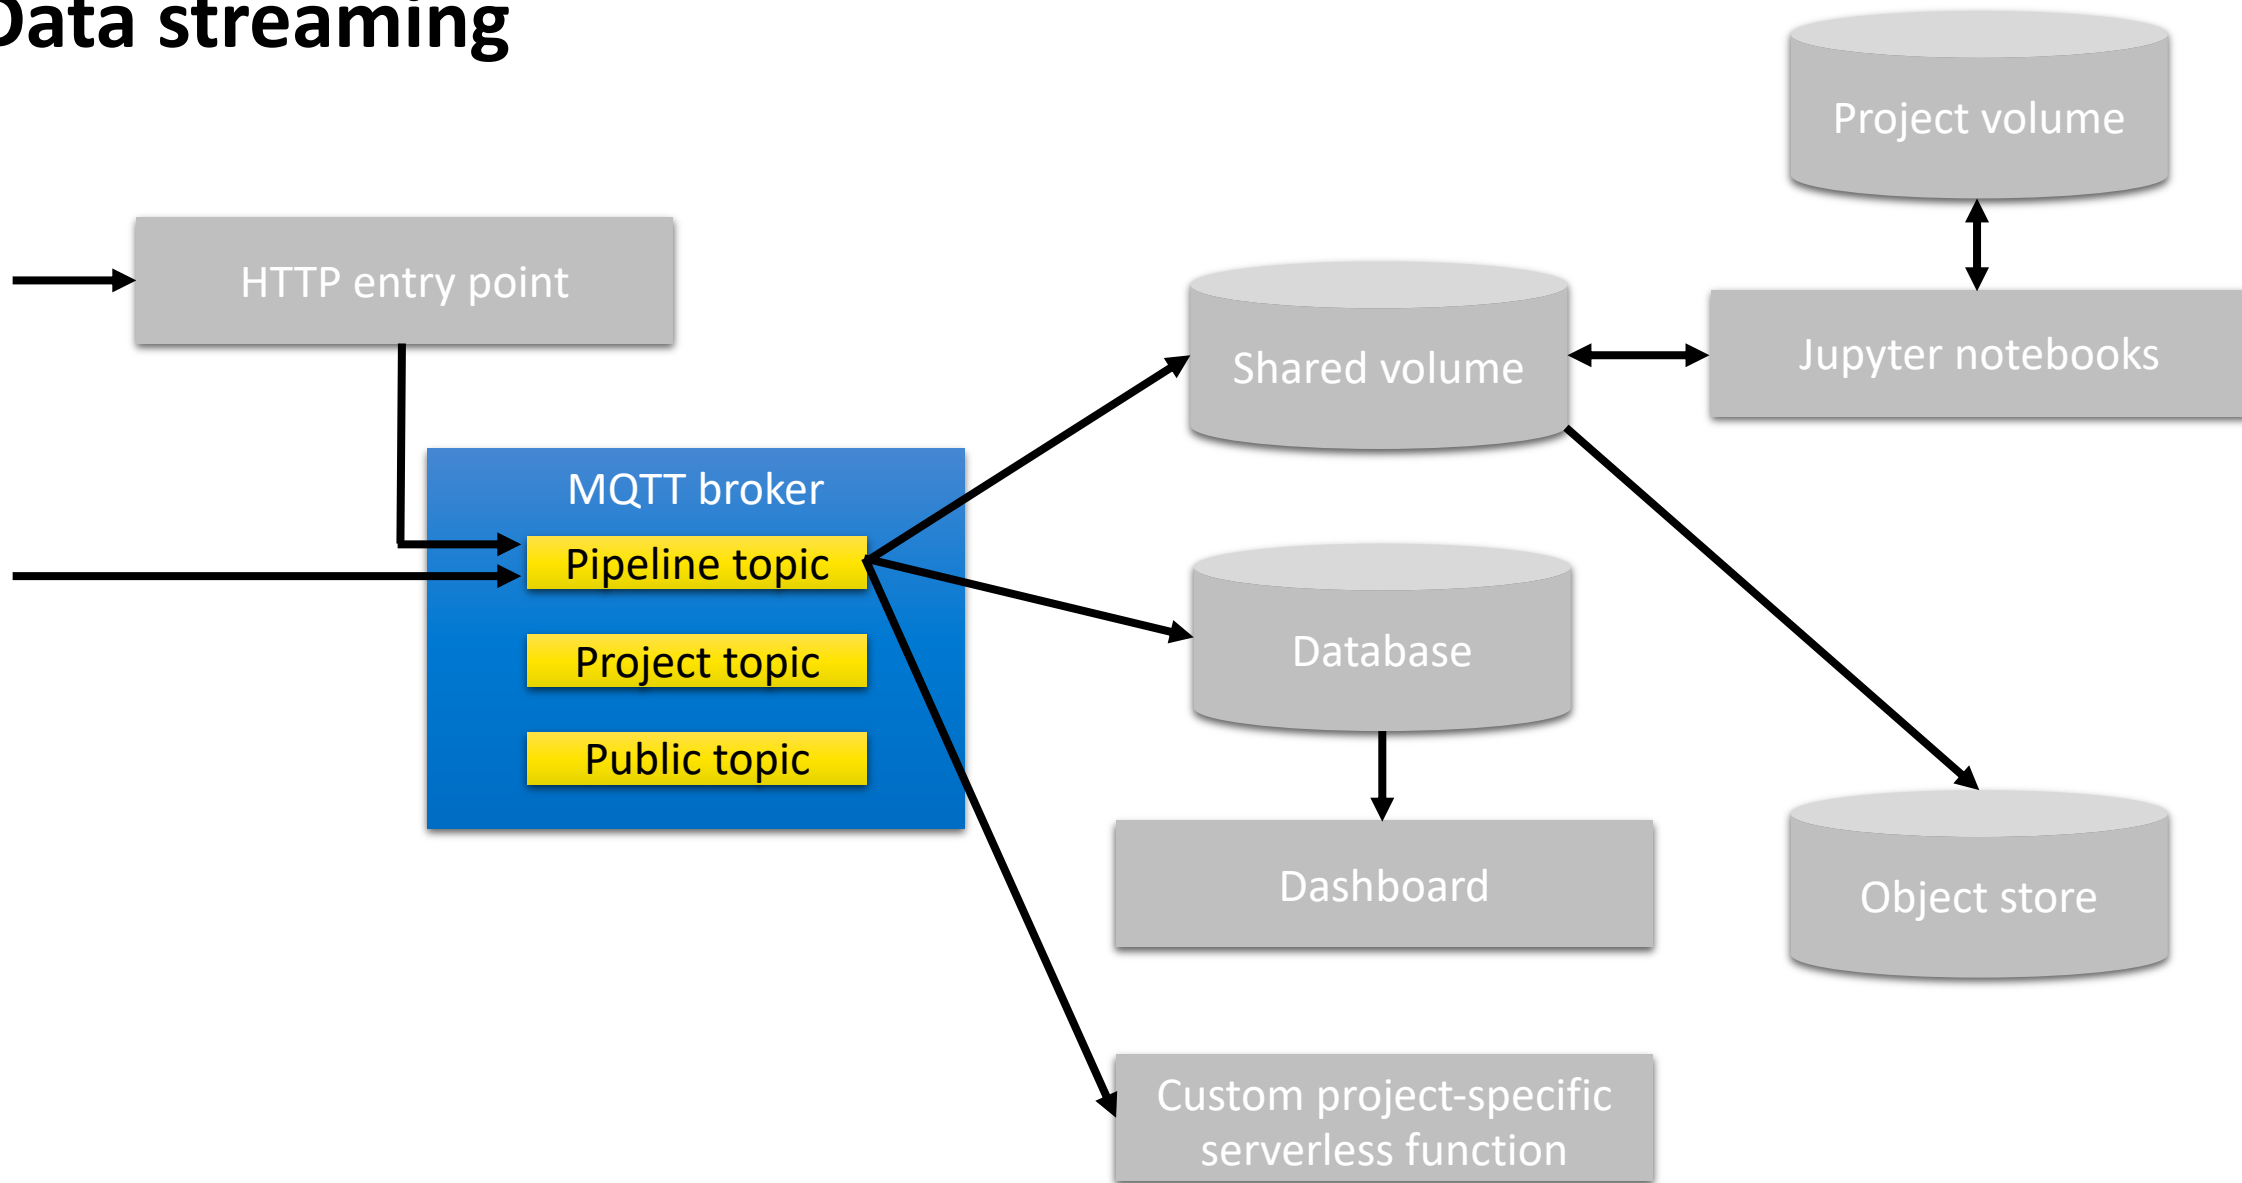

# Sensemakers IoT platform

- **Data streaming**
- **Data storage**
- **Analytics and visualizations**
- **Event-driven actions**

# Data streaming

# MQTT

- MQTT stands for Message Queuing Telemetry Transport
- extremely simple and lightweight messaging protocol designed for constrained devices and low-bandwidth, high-latency or unreliable networks
- became a standard for the Internet of Things
- **Mosquitto** is an open-source MQTT broker and serves as a backbone of the Sensemakers IoT platform. <https://mosquitto.org/>
- publish/subscribe to topics
- User authentication, access control lists

# Ingesting data

- Data can be sent to the platform in two ways:
  - **publish to MQTT**
  - **HTTP entry point**  
(works well with The Things Network HTTP integration)
- MQTT topics
  - **public** → for anyone to use
  - **private** → dedicated to each project
  - **automated pipeline** → store data in the platform and trigger actions

# Automated data pipeline

- Messages sent to the **pipeline/<app\_id>/<dev\_id>** topic are automatically:
  - stored in InfluxDB database
  - appended in JSON format to files in a shared volume
  - sent to a serverless function (if in place) to enable event-driven actions

[https://openfaas.sensemakersams.org/async-function/<app\\_id>](https://openfaas.sensemakersams.org/async-function/<app_id>)

# Automated data pipeline – Message format

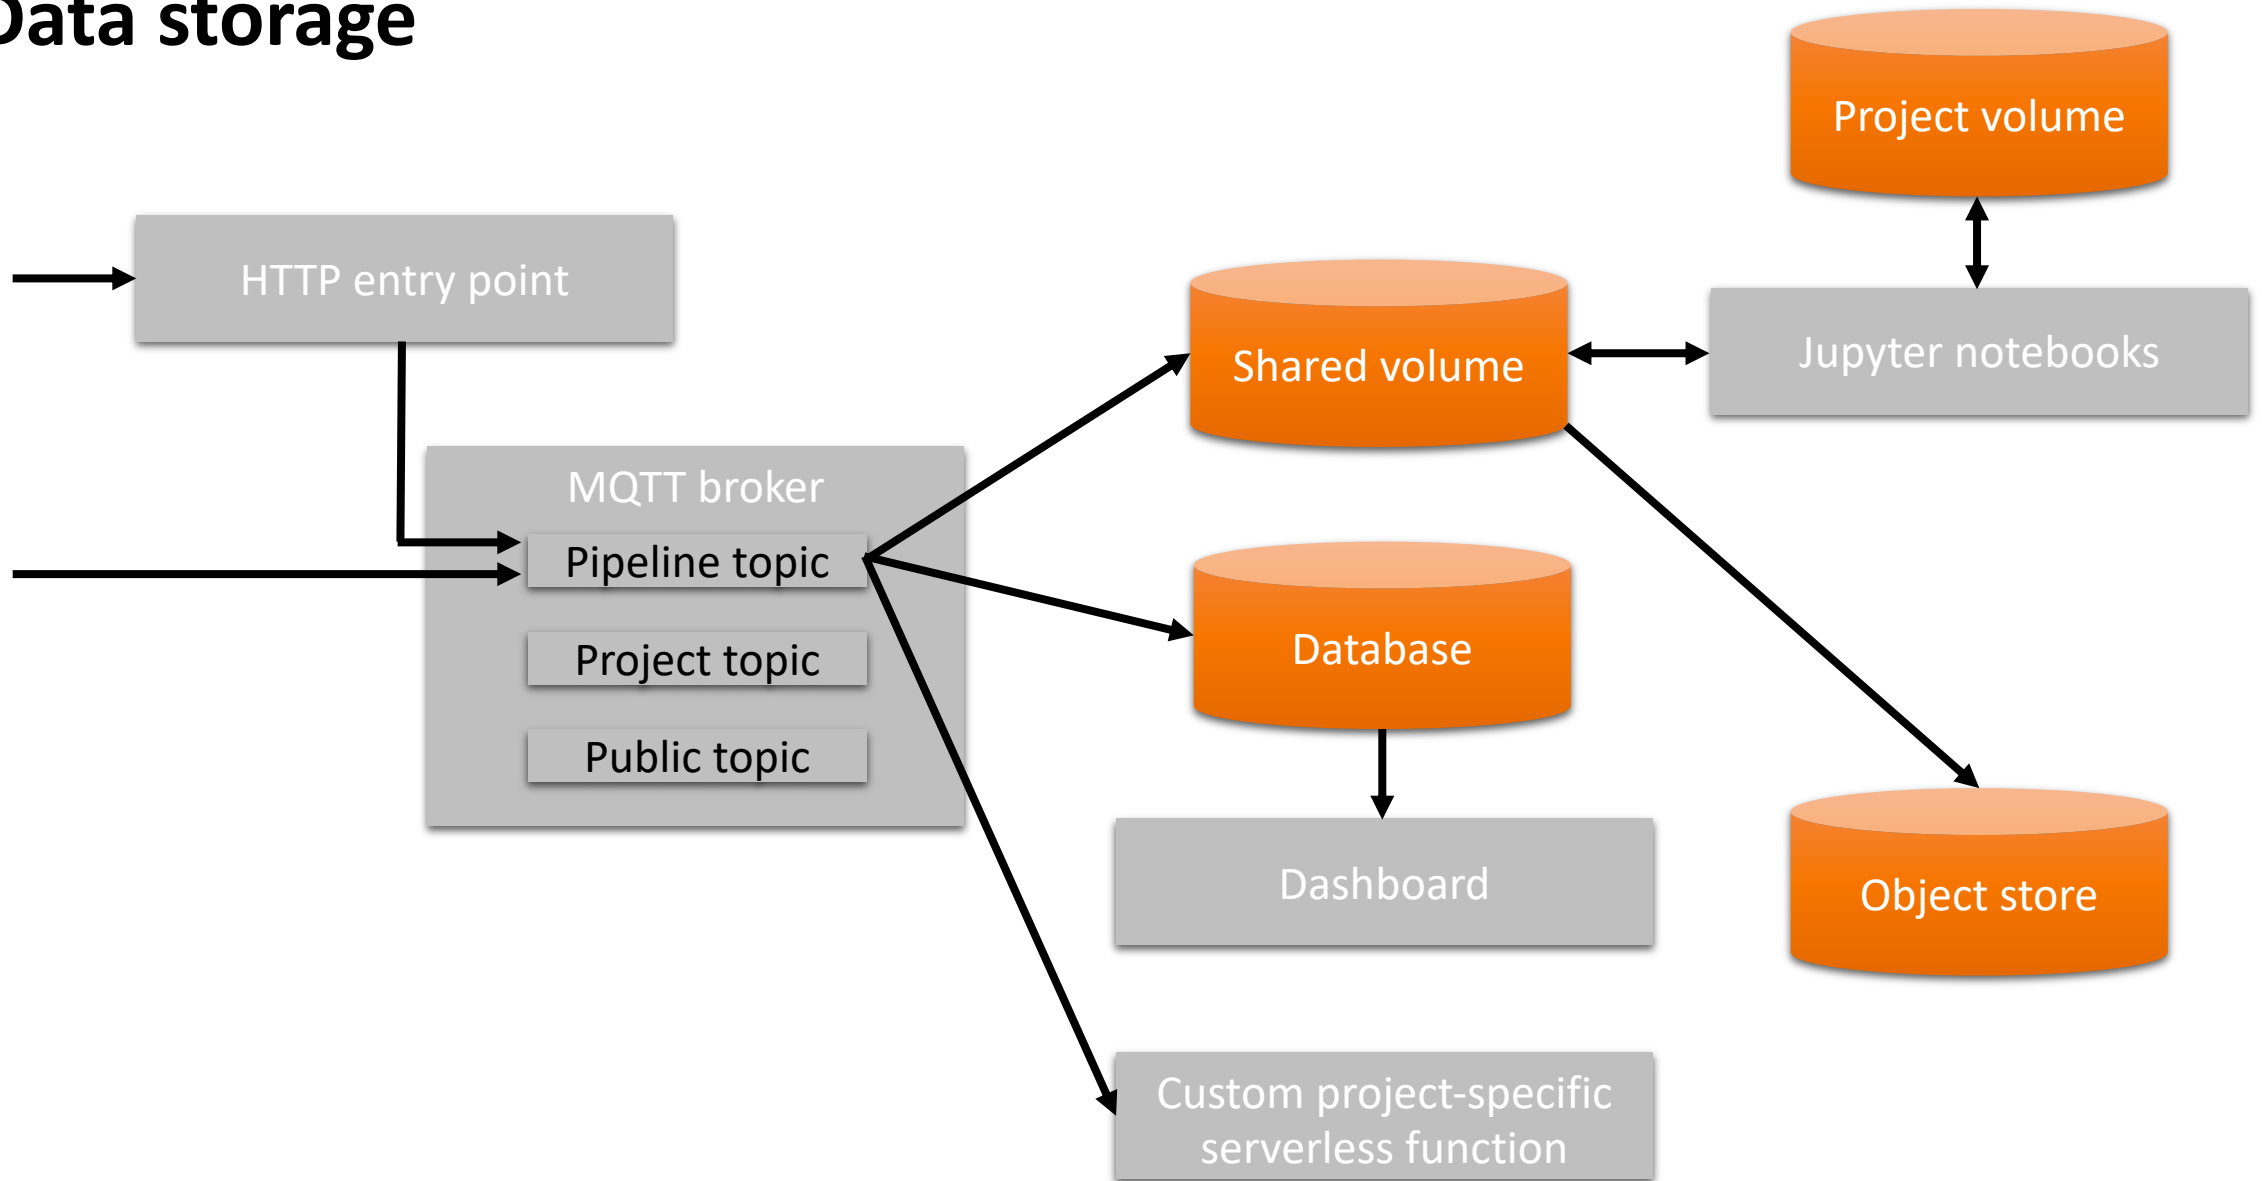

- Messages sent to the **pipeline/<app\_id>/<dev\_id>** topic have to comply with this JSON format.
- Standardized message format** is important for:
  - data sharing**
  - data management** and metadata extraction
- Example messages:

```
{"app_id": "test_project", "dev_id": "test_device",  
"payload_fields": {"temperature": 42},  
"time": 1557244616000}
```

```
{"app_id": "test_project", "dev_id": "test_device",  
"payload_fields": {"temperature": 42, "foo": "bar" },  
"tag_fields": {"foo": "bar"}, "foo": "bar"}
```

```
{  
  "type": "object",  
  "properties": {  
    "app_id": {  
      "type": "string"  
    },  
    "dev_id": {  
      "type": "string"  
    },  
    "payload_fields": {  
      "type": "object"  
    },  
    "time": {  
      "type": "integer"  
    },  
    "tag_fields": {  
      "type": "object"  
    }  
  },  
  "required": [  
    "app_id",  
    "dev_id",  
    "payload_fields"  
  ]  
}
```

# Data storage

# Data storage

- **Shared volume**

- Every message is appended to a file specific to a device and a calendar day.

- **InfluxDB** <https://docs.influxdata.com/influxdb/>

- InfluxDB is an open-source time series database.
- Data is available immediately.

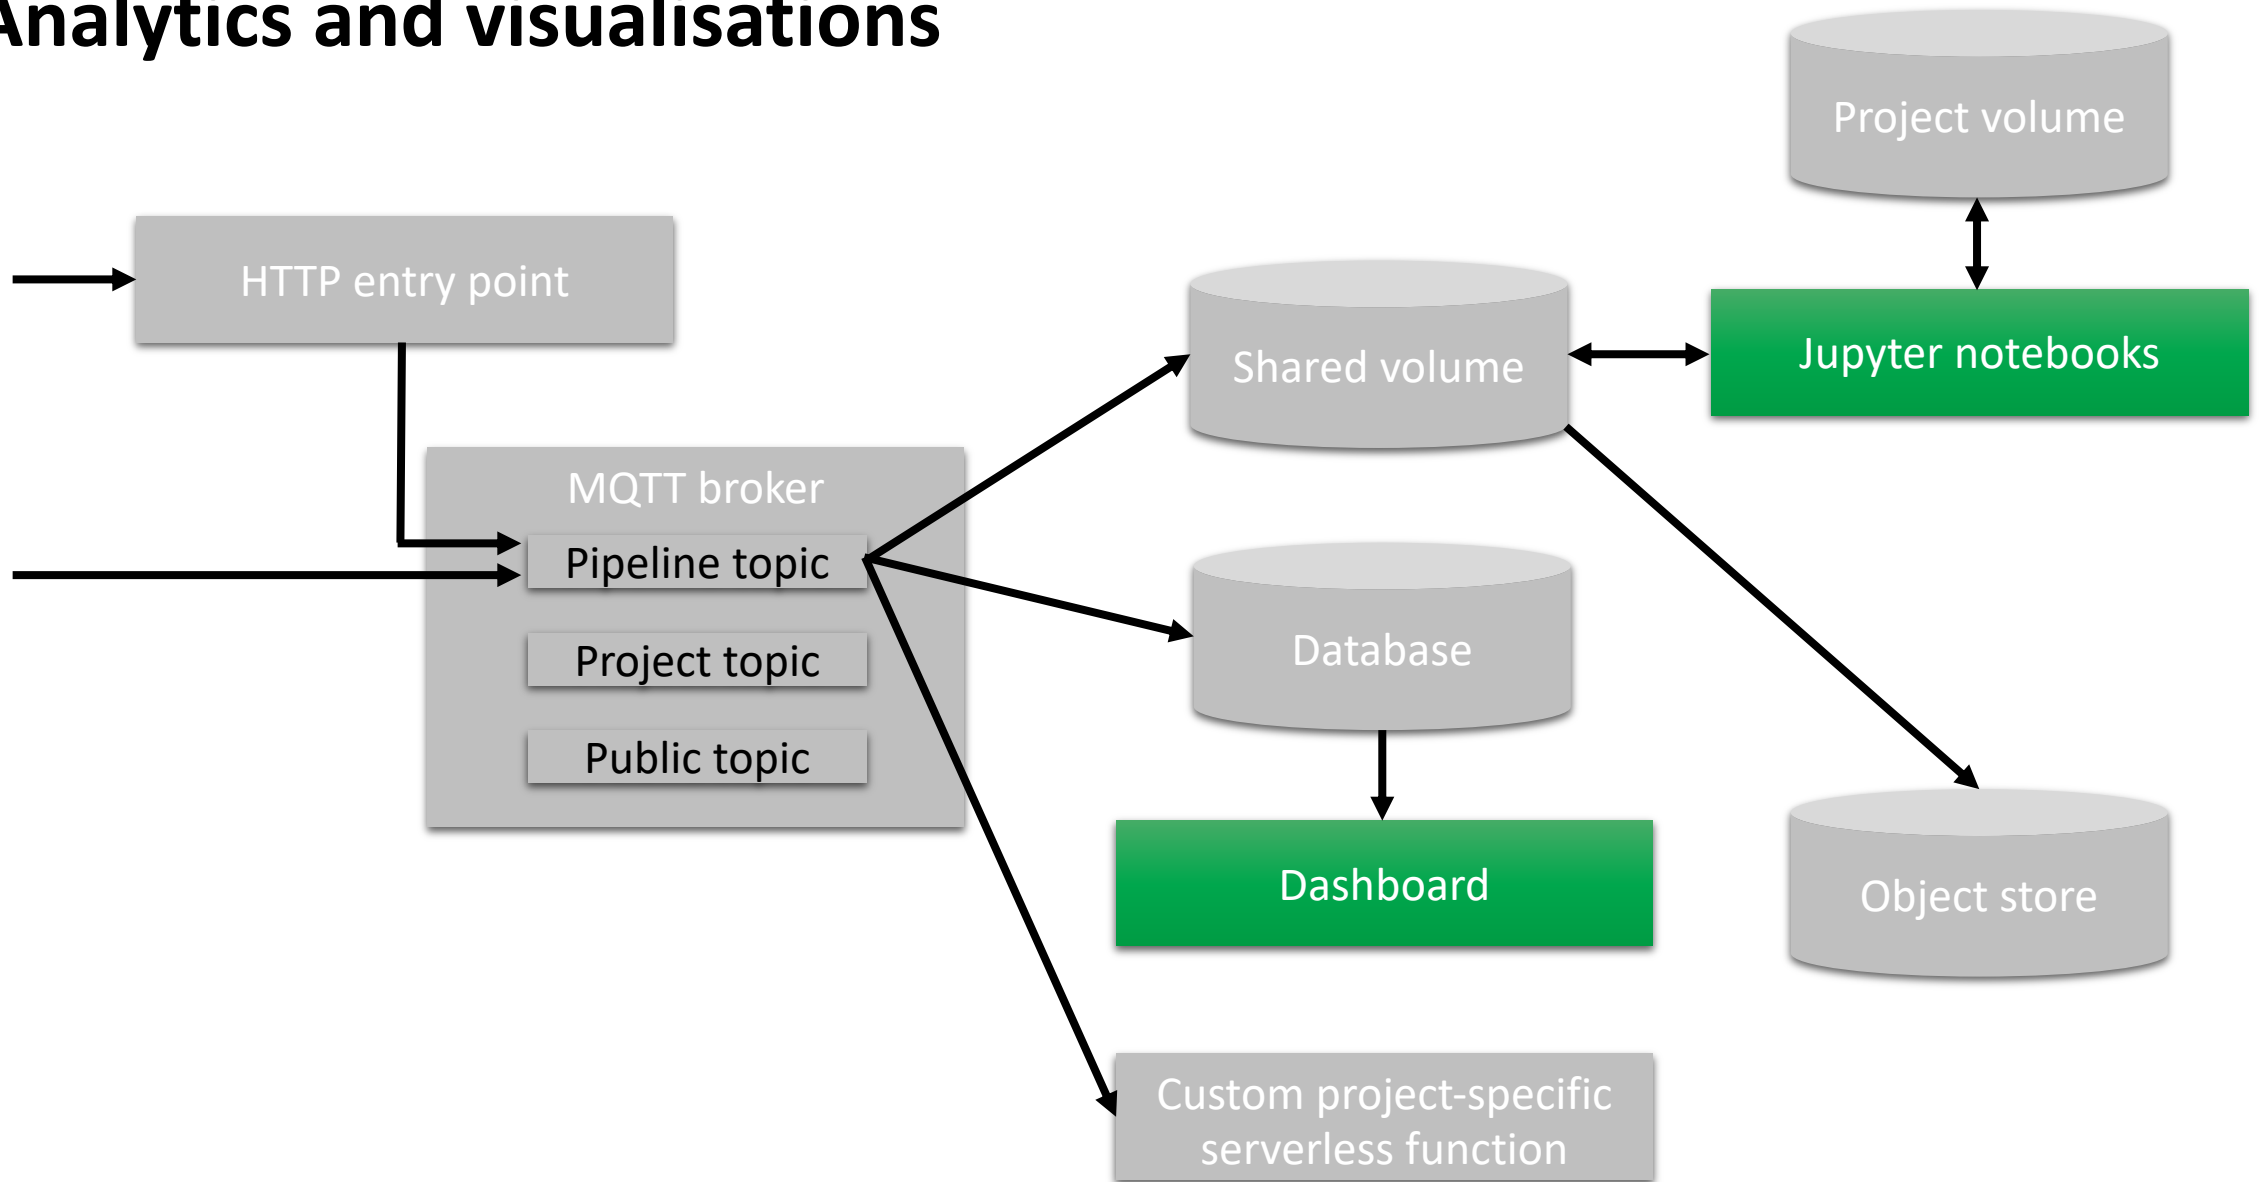

- **Object store**

- Minio is an open-source object store compatible with Amazon S3 <https://min.io/>

- used for periodic backups on a daily basis and metadata
- can be used for uploading larger files, e.g. images

# Analytics and visualisations

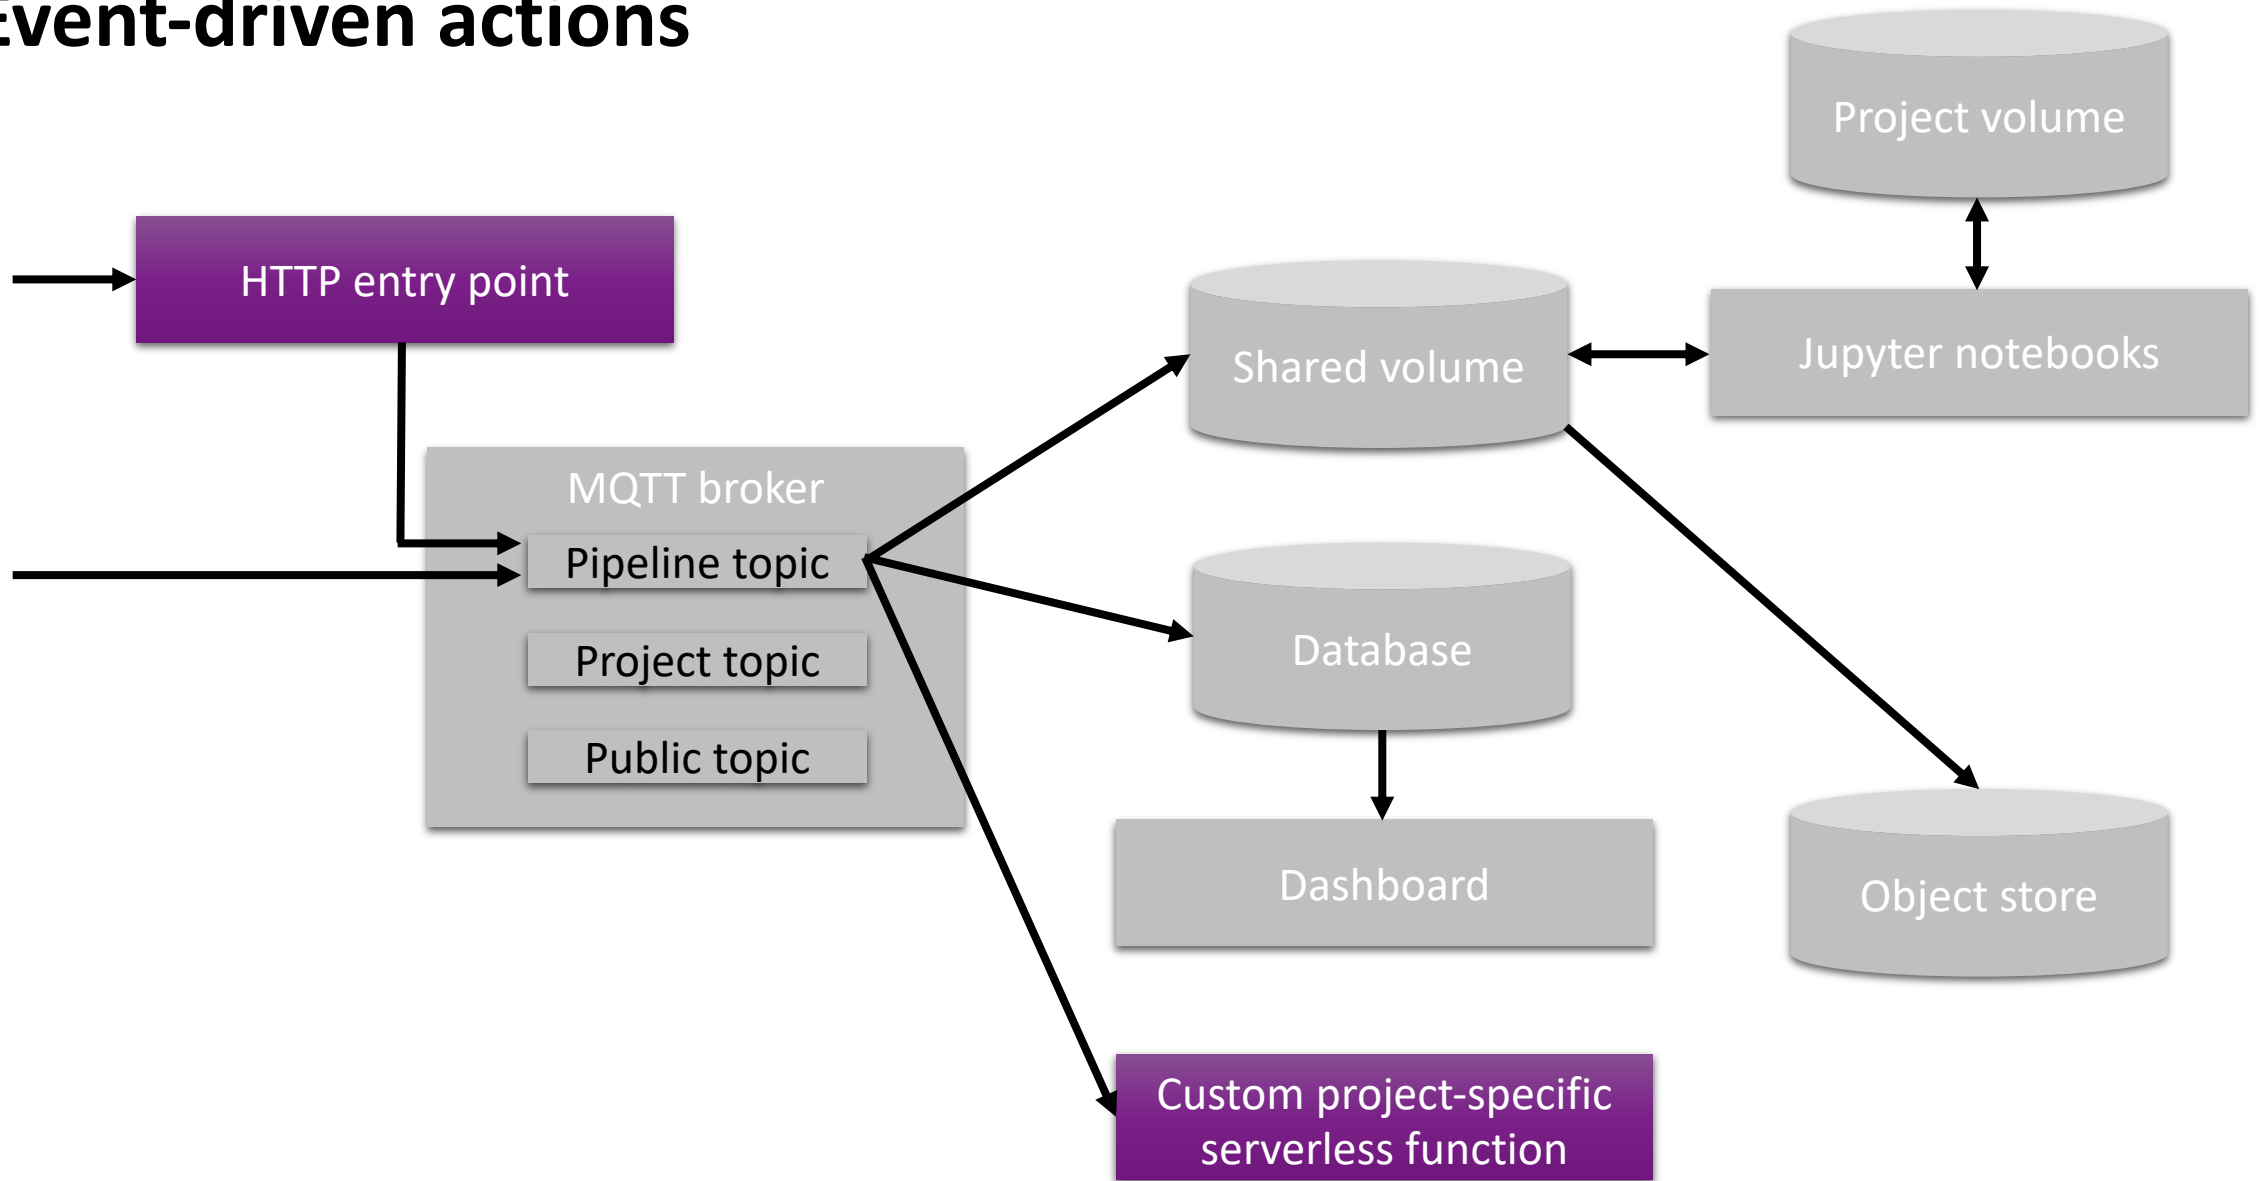

# Dashboards

- **Grafana** is available for visualizing data from InfluxDB and alerting.
- <http://docs.grafana.org/>
- **Jupyter** notebooks are available for data analytics purposes.
- <https://jupyter.org/hub>
- Every project gets its own Jupyter server with private storage space and access to the shared storage.

# Event-driven actions

# Serverless functions

- **OpenFaaS** framework is available to deploy serverless functions.
- <https://www.openfaas.com/>
- Functions can be deployed by a platform administrator.
- The HTTP endpoint for ingesting data to the platform is an OpenFaaS function that publishes the received message over MQTT to the pipeline topic for the corresponding project.

# Event-driven actions/talking back to devices

- Event-driven actions (i.e. executing code triggered by an incoming message) can be implemented in the following ways:
  - Run code that subscribes to an MQTT topic on your own machine.
  - Run code that subscribes to an MQTT topic on the Linux machine in the Sensemakers IoT platform.
  - Deploy a serverless function.

`https://openfaas.sensemakersams.org/async-function/<app\_id>`

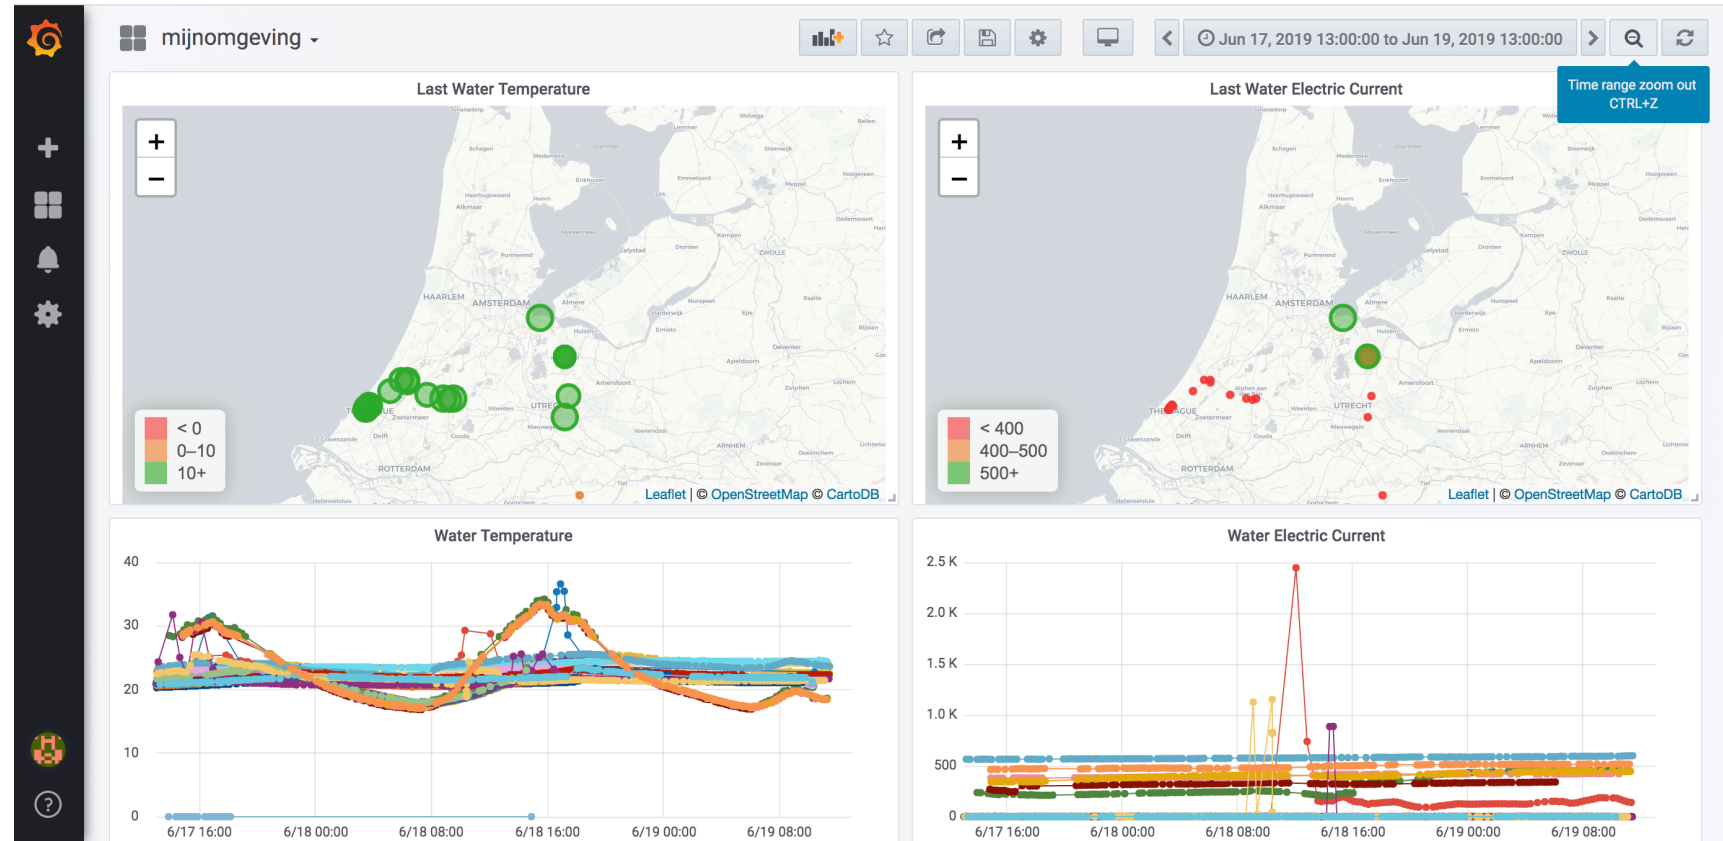

- The MQTT broker can be used to send messages back to devices. (provided the devices are capable of subscribing to MQTT topics)

# Using the Sensemakers IoT platform

- The Sensemakers IoT platform is designed to host **multiple projects**.  
(credentials/resources are given on a project-basis)
- One project is dedicated to **experimentation** → available for everyone  
(ask the credentials)
- There is a dedicated **github repository** for:
  - platform overview and technical **documentation**
  - **example code**
  - dashboard backups
  - <https://github.com/sensemakersamsterdam/sensemakers-iot-platform>

# Mijn Omgeving

- citizen science project initiated by The Dutch Police, Vodafone and SODAQ
- 40 sensors have been handed out to measure water quality
- <https://www.sensemakersams.org/mijnomgeving/>
