

MSc internship: Dispersal of exotic planarians

Exotic planarian species are increasingly found in greenhouses but also in gardens. To better understand their mobility and ability to colonize e.g. potted plants that may be shipped to other locations, we are looking for a MSc student interested in performing experimental research, and are not afraid to deal with certain levels of uncertainty as we know really little about the behavior of these animals.

Supervisors: Naomi Thunnissen, Eelke Jongejans, Frank Collas
