

# MEANINGFUL HUMAN CONTROL IN MILITARY APPLICATIONS, A NATO PERSPECTIVE

**AI TECH AGORA,  
26 FEBRUARY 2020**

Dr. Jurriaan van Diggelen

**TNO** innovation  
for life

The image features three large, stylized red question marks on a solid black background. One question mark is positioned in the upper left, another in the upper right, and a third, larger one in the center. The text 'MILITARY APPLICATIONS' is superimposed over the central question mark.

**MILITARY APPLICATIONS**

# USE AI FOR GOOD PURPOSES

*“AI should cultivate  
Human well-being”*

*The New York Times*

*June 1, 2018*

*Google Will Not Renew Pentagon  
Contract That Upset Employees*

After employees protested, a Google executive said Friday that the company will not renew a contract to work on artificial intelligence with the Pentagon after it expires next year. (Shantanu Banerjee)

# MY ACTIVITIES AT TNO

- › Project leader of Dutch Defense research projects on
  - › Human-machine teaming
  - › Meaningful Human Control
- › Chair of Nato activities on Meaningful Human Control
- › Coordinating Manning and Automation portfolio for Dutch Navy

## Why?

- To help Dutch Defense, Safety and Security
- To help preventing harmful and unethical applications of AI
- To help adopting multiple perspectives

## DUTCH DEFENSE

# Hijacked ship's crew rescued from pirates near Somalia

🕒 9 April 2017

🔗 Share

Jurriaan van Diggelen (TNO) - Human-Machine Teaming

# HOW FAR DO WE WANT TO GO?

# (MILITARY) AI REQUIRES MULTIPLE PERSPECTIVES

- Military AI roadmaps heavily rely on dual use technologies
- Applications require diverse perspectives from
  - Operational users, Academia, Industry
  - Multi-disciplinary: AI, Systems engineering, Human Factors, Legal, Ethics...
  - Multiple countries, ethnicities, etc.

The image features three large, stylized red question marks on a solid black background. One question mark is positioned in the upper left, another in the upper right, and a third, larger one in the center. The text 'NATO PERSPECTIVE' is centered horizontally across the middle of the image, overlaid on the central question mark.

**NATO PERSPECTIVE**

Year founded:  
**1949**

NATO has **2** official languages  
(English and French)

Number of member nations: **29**

Article **5** lays out the principle of  
collective defense

Number of members  
without an army: **1** (Iceland)

**MEANINGFUL HUMAN CONTROL**

US & WORLD | TECH | ARTIFICIAL INTELLIGENCE

## Putin says the nation that leads in AI 'will be the ruler of the world'

The Russian president warned that artificial intelligence offers 'colossal opportunities' as well as dangers

By James Vincent | @jvincent | Sep 4, 2017, 4:53am EDT

43

***“... by 2030, China’s AI theories, technologies, and applications should achieve world leading levels, making China the world’s primary AI innovation center...”***

## 6 VOORALSNOG LIJKT CHINA DE RACE TE WINNEN

Deze mondiale race om de beste en meeste AI speelt zich vooral af tussen de VS en China, waar China en route is om gaan winnen. Dit blijkt uit een vergelijking van Nederland en/of Europa met China en de VS op drie vlakken.

Het onderwijs in China is weliswaar kwalitatief wat minder goed dan dat van de VS en Europa, maar China compenseert dat op twee manieren. Ten eerste heeft China een relatief hoog aantal studenten in dit vakgebied. Op haar beste drie universiteiten (lager in bovenstaande ranking) leidt China

Translated from Chinese AI Development Plan, July 2017

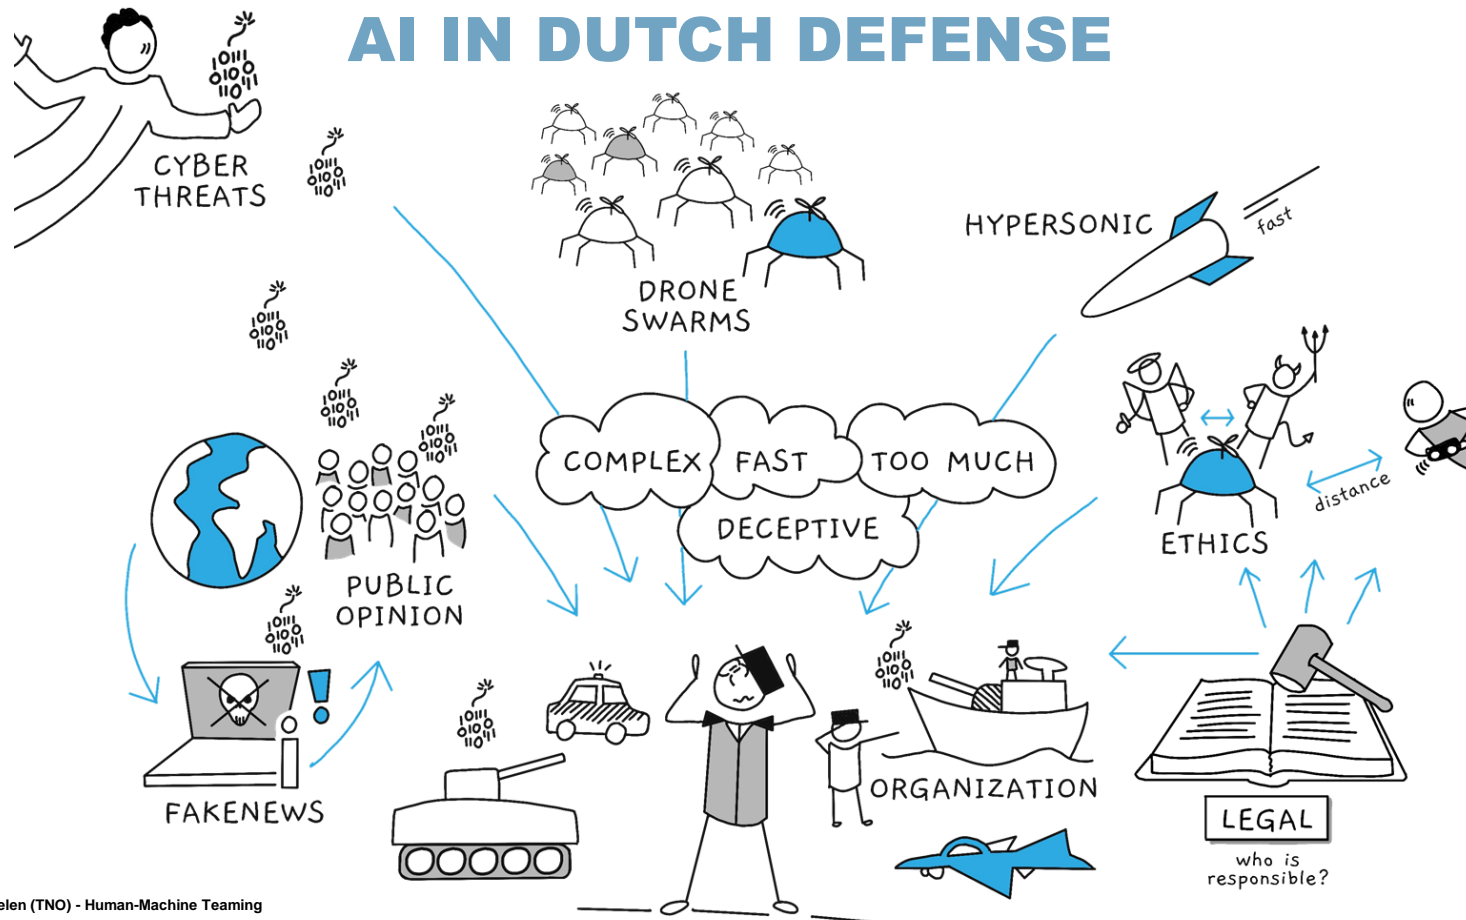

***“And we believe quite strongly that the technological sauce of the Third Offset is going to be advances in Artificial Intelligence (AI) and autonomy.”***

Former U.S. Deputy Secretary of Defense Bob Work, April 2016

# AI IN DUTCH DEFENSE

# MEANINGFUL HUMAN CONTROL

The battle is too fast to allow human involvement,  
so we need autonomous AI!  
Artificial ethics can make war more humane.

# MEANINGFUL HUMAN CONTROL

*Prohibit all LAWS!*

**Article 36**

*Humans should exercise control over individual attacks, not simply overall operations. Only by prohibiting the use of fully autonomous weapons can such control be guaranteed.*

# NATO HFM-ET-178: MHC OVER AI BASED SYSTEMS

AFRL  
TNO  
DSTL  
NASA  
Fraunhofer  
FOI

*Humans have the ability to make informed choices in sufficient time to influence AI-based systems in order to enable a desired effect or to prevent an undesired immediate or future effect on the environment.*

## Characteristics:

- Human has freedom of choice
- Human has ability to impact the behaviour of the system
- Human has time to decide to engage and sufficient situation, and system understanding
- Human is capable to predict the behavior of the system and the effects of the environment (physical and information)
- Influence over AI-based systems can be achieved in various ways, such as policy-making, training, HMI design, organizational design, operations, etc.
- The above encompasses cases from instantaneous (e.g. number of seconds) to very delayed response (several hours to days, e.g. before-the-loop) to control.

THERE'S NO SILVER BULLET  
*for meaningful human control*

## FIVE ROLES FOR AI

- › AI as a substitution for human
- › AI as an obedient servant
- › AI as a human enhancer
- › AI as work creator
- › AI as a team partner

# ROLE 1 AI AS A SUBSTITUTION FOR HUMANS

# ALPHA (GO) ZERO

# AI AS A SUBSTITUTION FOR HUMANS REQUIRES HUMAN-LEVEL INTELLIGENCE OR ABOVE

## TOWARD DIRECT BRAIN-COMPUTER COMMUNICATION

9027

JACQUES J. VIDAL<sup>1</sup>

Brain Research Institute,  
University of California, Los Angeles, California

Electroencephalographic or EEG signals collected on the human scalp are sustained fluctuations of electrical potential that reflect corresponding variations in the upper layers of the brain cortex below the scalp surface. The signal structure is that of a stochastic time series with almost stationary epochs of various lengths separated by sharper transitions or disruptions. Amplitudes are small (up to a few tens of microvolts) and spectral decomposition reveals that very little power remains at frequencies above 30 Hz. Most of it is contained at very low frequencies (< 1 Hz) and within the narrow bands of specific rhythms (and particularly of the 8-13 Hz alpha rhythm) that appear and disappear somewhat randomly in time. Signals collected on two or more electrodes exhibit changing levels of correlation, due either to physical proximity (that is, sharing of immediate influences from the cortical surface) or to actual coordination between different cortical sites, thus reflecting shared neuron activity within the brain itself. Spectral content and correlation have been related to various emotional and behavioral states.

Imbedded in this sustained "spontaneous" or "ongoing" electrical activity, short, distinctive (0.5-2 sec) waveforms can be found that are evoked, for instance, when a brief sensory message (stimulus) such as a brief illumination of the visual field or a tap on the forearm is received by the subject. These "evoked responses" are small (a few microvolts) and somewhat buried in the ongoing activity. The characteristics of the stimulus determine the evoked potential waveform together with the stimulus "environment," such as the level of attention of the subject, the "expectation set," and the meaning of the stimulus in the context of the experiment.

Can these observable electrical brain signals be put to work as carriers of information in man-computer communication or for the purpose of controlling such external apparatus as prosthetic devices or spaceships? Even on the sole basis of the present states of the art of computer science and neurophysiology, one may suggest that such a feat is potentially around the corner.

The Brain Computer Interface project, described later in this chapter, was meant to be a first attempt to evaluate the feasibility and practicality of utilizing the brain
